Instruction Manual

Tektronix

1730-Series Waveform Monitor (SN B070000 and Above) 070-7948-05

Warning

The servicing instructions are for use by qualified personnel only. To avoid personal injury, do not perform any servicing unless you are qualified to do so. Refer to all safety summaries prior to performing service.

WARRANTY

Tektronix warrants that this product, that it manufactures and sells, will be free from defects in materials and workmanship for a period of three (3) years from the date of shipment. If any such product proves defective during this warranty period, Tektronix, at its option, either will repair the defective product without charge for parts and labor, or will provide a replacement in exchange for the defective product.

In order to obtain service under this warranty, Customer must notify Tektronix of the defect before the expiration of the warranty period and make suitable arrangements for the performance of service. Customer shall be responsible for packaging and shipping the defective product to the service center designated by Tektronix, with shipping charges prepaid. Tektronix shall pay for the return of the product to Customer if the shipment is to a location within the country in which the Tektronix service center is located. Customer shall be responsible for paying all shipping charges, duties, taxes, and any other charges for products returned to any other locations.

This warranty shall not apply to any defect, failure or damage caused by improper use or improper or inadequate maintenance and care. Tektronix shall not be obligated to furnish service under this warranty a) to repair damage resulting from attempts by personnel other than Tektronix representatives to install, repair or service the product; b) to repair damage resulting from improper use or connection to incompatible equipment; c) to repair any damage or malfunction caused by the use of non-Tektronix supplies; or d) to service a product that has been modified or integrated with other products when the effect of such modification or integration increases the time or difficulty of servicing the product.

THIS WARRANTY IS GIVEN BY TEKTRONIX WITH RESPECT TO THIS PRODUCT IN LIEU OF ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED. TEKTRONIX AND ITS VEN-DORS DISCLAIM ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. TEKTRONIX' RESPONSIBILITY TO REPAIR OR REPLACE DE-FECTIVE PRODUCTS IS THE SOLE AND EXCLUSIVE REMEDY PROVIDED TO THE CUS-TOMER FOR BREACH OF THIS WARRANTY. TEKTRONIX AND ITS VENDORS WILL NOT BE LIABLE FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAM-AGES IRRESPECTIVE OF WHETHER TEKTRONIX OR THE VENDOR HAS ADVANCE NO-TICE OF THE POSSIBILITY OF SUCH DAMAGES.

General Safety Summary

Review the following safety precautions to avoid injury and prevent damage to this product or any products connected to it. To avoid potential hazards, use this product only as specified.

Only qualified personnel should perform service procedures.

To Avoid Fire or
Personal InjuryUse Proper Power Cord. Use only the power cord specified for this product and
certified for the country of use.

Connect and Disconnect Properly. Do not connect or disconnect probes or test leads while they are connected to a voltage source.

Ground the Product. This product is grounded through the grounding conductor of the power cord. To avoid electric shock, the grounding conductor must be connected to earth ground. Before making connections to the input or output terminals of the product, ensure that the product is properly grounded.

Observe All Terminal Ratings. To avoid fire or shock hazard, observe all ratings and markings on the product. Consult the product manual for further ratings information before making connections to the product.

Do not apply a potential to any terminal, including the common terminal, that exceeds the maximum rating of that terminal.

Do Not Operate Without Covers. Do not operate this product with covers or panels removed.

Use Proper Fuse. Use only the fuse type and rating specified for this product.

Avoid Exposed Circuitry. Do not touch exposed connections and components when power is present.

Do Not Operate With Suspected Failures. If you suspect there is damage to this product, have it inspected by qualified service personnel.

Do Not Operate in Wet/Damp Conditions.

Do Not Operate in an Explosive Atmosphere.

Keep Product Surfaces Clean and Dry.

Provide Proper Ventilation. Refer to the manual's installation instructions for details on installing the product so it has proper ventilation.

Symbols and Terms

WARNING. Warning statements identify conditions or practices that could result in injury or loss of life.

CAUTION. Caution statements identify conditions or practices that could result in damage to this product or other property.

Terms on the Product. These terms may appear on the product:

Terms in this Manual. These terms may appear in this manual:

DANGER indicates an injury hazard immediately accessible as you read the marking.

WARNING indicates an injury hazard not immediately accessible as you read the marking.

CAUTION indicates a hazard to property including the product.

Symbols on the Product. The following symbols may appear on the product:

Not suitable for connection to the public telecommunications network

Double Insulated

Preface

This manual documents the TEKTRONIX 1730–Series Waveform Monitor (B070000 and Up). Information that applies to all instruments in the series refers to the 1730–Series. Information that applies to only specific instruments within the series refers to the model numbers of those instruments (i.e., 1730, 1731, etc.).

The information in this manual is intended for instrument operators and service technicians. Operators are assumed to be familiar with basic television terms and measurements. Qualified service technicians are also assumed to be familiar with television terms and measurements, and have moderate experience with analog and logic circuits.

Section 1, Introduction, includes a general description of the instrument followed by the Specifications. The Specifications include references to the corresponding Performance check steps.

Section 2, Operating Instructions, familiarizes the user with the front– and rear– panel controls, connectors, and indicators; includes an operator's checkout procedure; and includes other operator familiarization information.

Section 3, Installation, includes electrical and mechanical installation information. The electrical installation information includes power mains conversion, adjustments, and operational changes available with the instrument. The mechanical installation information includes rackmounting, custom installation, and portable use.

Section 4, Theory of Operation, provides an overall block diagram description and detailed circuit descriptions. Read the block diagram description for an overview of the instrument. The detailed circuit descriptions should be used with the block diagram and schematic diagrams in the foldout pages for specific information about individual circuits.

Section 5, Checks and Adjustments, includes the Performance Check Procedure and the Adjustment Procedure. The Performance Check Procedure is used to verify that the instrument's performance is within its specifications, and the Adjustment Procedure is used to adjust the instrument to meet its specifications. The procedures are preceded by a list of recommended test equipment. Each procedure has a short form listing of the individual steps.

Section 6, Maintenance, includes preventive, troubleshooting, and corrective information.

Section 7, Options, contains summaries of available instrument options. Additional information concerning options is included in appropriate places throughout the manual.

Section 8, Replaceable Electrical Parts, includes ordering information and part numbers for all replaceable electrical parts.

Contacting Tektronix

Product Support	For application-oriented questions about a Tektronix measure- ment product, call toll free in North America: 1-800-TEK-WIDE (1-800-835-9433 ext. 2400) 6:00 a.m. – 5:00 p.m. Pacific time
	Or contact us by e-mail: tm_app_supp@tek.com
	For product support outside of North America, contact your local Tektronix distributor or sales office.

Introduction and Specifications

Section 1 Introduction and Specification

The TEKTRONIX 1730-Series is an 8-1/2-inch wide by 5-1/4-inch high waveform monitor, weighing approximately 8 pounds. The 1730 (System M, NTSC) and the 1731 (System I, B, etc., PAL, PAL-M), and the 1735 (dual-standard) versions can be powered from an ac source or, with the addition of a field upgrade kit (1700F10), 12 Vdc. The CRT occupies approximately two-thirds of the front-panel area, with the control panel taking up the remainder of the space. Operation is controlled by a microprocessor that polls the front-panel switches and remote ground closures. Front-panel switches are of the momentary touch type with lighted functional indicators. Most of the switches are also used to select special functions, which are accessed by holding the switches in until the microprocessor recognizes the request.

The signal is displayed on a bright CRT capable of displaying one line per frame. It is of the mesh type, for better geometry, and uses an internal graticule to reduce parallax. Variable graticule scale illumination provides even lighting to improve measurement accuracy and the quality of waveform pictures. Option 74 provides a P4 (white) phosphor tube.

The Channel A and B Composite Video Inputs and the External Reference Signal Input are high impedance bridging loop-throughs, in order to protect the integrity of the signal paths. The input switching allows for the display of either Channel A or Channel B Input or both inputs. Synchronization can be either internal or external, with the further choices of using remote sync or 90 or 100 Hz synchronization, from a VTR, where the application warrants.

The 1730-Series offers a choice of three basic sweep rates: 2 Field, 2 Line, and 1 Line, each of which can be magnified to provide three additional sweep rates: $1 \mu s$ (2 Line), $0.2 \mu s$ (1 Line), and X25 (2 Field) which provides for viewing the complete vertical interval. In addition, there is full frame line selection that can be displayed as 1 line, 2 lines, or 15 lines. A bright-up pulse, for picture monitors, that corresponds to the intensified region on the CRT display, is available through a rear-panel bnc connector.

The vertical signal processing provides a choice of fast or slow dc restoration, or an unclamped display. The input signal can be unfiltered (Flat) or either Low Pass or Chrominance filtered. There is also a combination of Flat and Low Pass filtering available when a 2 Line or 2 Field sweep rate is employed; the display consists of one line or field low pass filtered while the second is unfiltered. Vertical amplitudes can be displayed in a calibrated gain mode, which corresponds directly with the graticule vertical scales, magnified 5 times, or can be set to a specific amplitude by using the Variable GAIN control. An RGB or YRGB Parade display, for camera setup, is accommodated with a shortened sweep. The input of the camera signal and an enable are through the rear-panel REMOTE jack. The choice of 3-step (RGB) or 4-step (YRGB) is made by changing the position of an internal jumper.

The 1730-Series has a unique Store and Recall function built in that allows for the storing of up to four front-panel setups that can be recalled by pressing the appropriate recall button, or a ground closure through the rear-panel REMOTE connector. In addition, four factory-programmed measurement setups can be accessed, by external ground closures input through the REMOTE connector.

An auxiliary output, to control a companion 1720-Series Vectorscope, is provided through a rear-panel connector. The auxiliary output contains a bus for two-way communications between the waveform monitor and vectorscope microprocessors and a strobe to provide line select unblanking for the Vectorscope.

Typical Configurations

The 1730-Series Waveform Monitor is designed for operation either alone or with a 1720-Series Vectorscope. Line select and measurement recall for this waveform monitor are also used by the vectorscope. Because of these capabilities, and the available 90 or 100 Hz triggering, the 1730-Series Waveform Monitor is ideally suited to operate in a VCR bridge. With its factory-preset measurement routines, that can be accessed through the rear-panel REMOTE connector and the Store/Recall functions, it is possible to have one-button measurements of key parameters, including various vectorscope measurements.

In addition to the VCR bridge and the typical Master Control monitoring applications, this monitor can be used in camera chains. It has a choice of RGB or YRGB Parade display that can easily be selected by changing one internal jumper setting. The Parade signal and enable are input through the rear-panel REMOTE connector.

A number of operating conditions can be altered by changing internal jumpers, using some of the factory-preset combinations, or setting up and saving the front panel with the Store/Recall function. Using these methods most of the current 528A operational modes can be accommodated. There is a difference in how the remote control operates — the 1730-Series uses ground closures, not positive voltage as the 528A did.

Options

CRT Options	The standard instrument is shipped with a P31 (green) phosphor CRT installed. Option 74 instruments are shipped with a P4 (white) phosphor CRT installed.
Power Cord Options	Any of the power cord options described in Section 7 can be ordered for the 1730-Series. If no power cord option is ordered, instruments are shipped with a North American 125 V power cord and one replacement fuse.
Accessories	
Standard Accessories	The following accessories are shipped with the 1730-Series. Part numbers for these accessories are located at the end of the Replaceable Mechanical Parts list.
	1 1730-Series Instruction Manual
	1 Power Cord, with selected power plug option
	1 Replacement Cartridge Fuse (correct rating for the power plug option)
	Replacement Scale Illumination Bulbs (Tektronix Part No. 150-0168-00 or ANSI #73)
Optional Accessories	There are a number of accessories that can be used with a 1730-Series Waveform Monitor. The following is a list of the most common accessory items for this series of waveform monitors. 1700F items are Field Upgrade Kits that are installed by the customer; instructions are included in all Field Upgrade Kits.
	Viewing Hood (016-0475-00)
	Front Panel Cover (200-3897-01)
	1700F00, Plain Cabinet (painted silver-grey)
	1700F02, Portable Cabinet (painted silver-grey)
	1700F05, Side-by-Side Rack Adapter
	1700F06, Blank Half-Rack Width Panel
	1700F10, DC Power Converter

Safety Information

The 1730-Series is intended to operate from an ac power source that will not apply more than 250 V rms between the supply conductors or between either supply conductor and ground. A protective ground connection by way of the grounding conductor is essential for safe operation (except for those instruments that are operated from a battery supply).

The 1730-Series was tested for compliance in a cabinet. To ensure continued compliance, the instrument will need to be enclosed in a cabinet that is equivalent to the Factory Upgrade Kits that are listed as Optional Accessories for the 1730-Series. A drawing of the 1700F00 plain cabinet is contained in the Installation Instructions (Section 3).

Specification

In the specification tables that follow, some items are identified as performance requirements. These can be verified by performing the Performance Check Procedure in Section 5. Not all performance requirements have a measureable tolerance, and therefore do not have a performance check step; however, they are either verified by indirect means, through other portions of the procedure, or are design criteria that do not need to be tested for individual instruments.

Whenever there is a verifiable performance requirement, in the specification table, there will also be a reference to identify the location, in the Performance Check Procedure, of the appropriate performance verification procedure.

The supplemental Information designation in the tables indicates that this is information that either amplifies a performance requirement or is special information that is of importance. Unlike performance requirements, there is no need, and often no way to check these items to any specific tolerance.

Characteristic	Requirement	Supplemental Information	Step Number
Frequency response Flat	Flat: 50 kHz to 6 MHz within 2% of response at 50 kHz. Flat (X5): 50 kHz to 6 MHz within 5% of response at 50 kHz.	Specifications apply for full screen height video input signal, with variable GAIN off.	13
Low-pass filter	1730: At least 30 dB attenuation at 3.58 MHz 1735: 4.00 MHz 1731: 4.43 MHz	Response at 15 kHz does not vary between FLAT and LPASS by more than 1%	17
Chroma filter	NTSC and PAL-M: Nominal bandwidth 1 MHz. Attenuation at 7.2 MHz 20 dB or greater. Response at 3.58 MHz does not vary between FLAT and CHROMA by more than 1%.	Upper and lower –3 dB points are approximately ±350 kHz from 3.579545 MHz. 15 to 35 °C operating temperature.	
	PAL: Nominal bandwidth 1 MHz. Attenuation at 8.9 MHz 20 dB or greater. Response at 4.43 MHz does not vary between FLAT and CHROMA by more than 1%.	Upper and lower –3 dB points are approximately ±350 kHz from 4.433619 MHz. 15 to 35 °C operating temperature.	18
Transient response	Preshoot: ≤1% Pulse-to-Bar Ratio: X1: 0.99:1 to 1.01:1X5: 0.98:1 to 1.02:1 Overshoot: X1: 2% or less X5: 4% or less Ringing: X1: 2% or less X5: 4% or	Specifications apply for full screen height video input signal, with variable GAIN off.	15, 16
	less		
Field rate tilt	≤1%	Field rate square wave or vertical window	15
Line rate tilt	≤1%	25 ms bar	15
Overscan	Less than 2% variation in baseline of 100 IRE (700 mV) 12.5T (20T) modulated pulse as it is positioned over the middle 80% of the screen.		15
Differential gain	Displayed differential gain is $\leq 1\%$ with 10% to 90% APL changes.	Chroma filter must be selected. Baseline at 50 IRE and displayed subcarrier adjusted to 100 IRE with VAR gain.	
Deflection factor	140 IRE (1.0 V) within 1% with 1 V input.	1 V full scale. 20-30 °C, Flat response selected. Vertical gain temperature coefficient is –0.3%/10 °C.	9

Table 1–1: Vertical Deflection System

Table 1–1: Vertical Deflection S	System	(Cont.)
----------------------------------	--------	---------

Characteristic	Requirement	Supplemental Information	Step Number
X5 gain accuracy	±5%	1 V input signal	9
X5 gain registration	≤1 major div. of vertical shift from baseline.	Unmagnified to magnified display	9
Variable gain range	Input signals between 0.8 V and 2 V can be adjusted to 140 IRE (1.0 V) display. 160 mV and 400 mV for X5 gain.		9
Position range	1 V signal can be positioned so that peak white and sync tip can be placed at blanking level, with the DC RE- STORER on, regardless of gain setting.	Applies to calibrated gain positions only	9
Maximum absolute input level	±5 VDC + peak AC	Displays in excess of 200 IRE (1.428 V) may cause frequency response aberrations.	
DC input impedance	Greater than 15 k Ω (unterminated)		
Return Loss (75 Ω) video inputs (CH-A, CH-B)	≥40 dB from 50 kHz to 6 MHz	A and B channels, loop-through terminated in 75Ω . Input in use or not in use, instrument power on or off, all deflection factor settings.	19
Crosstalk between channels		Greater than 50 dB of isolation between channels. Measured at F _{SC} between Channel A, Channel B, and EXT REF.	
Loop through isolation		Greater than 80 dB of isolation between loop-throughs. Measured at F _{SC} between Channel A, Channel B, and EXT REF.	
PIX MON frequency response	50 kHz to 6 MHz, within 3% of response at 50 kHz	Terminated in 75 Ω	14
PIX MON differential gain (50% APL)	Within 1% with a 140 IRE (1.0 V) unit display		
PIX MON differential phase (50% APL)	Within 1° with a 140 IRE (1.0 V) unit display		
PIX MON DC level on output	0.5 V or less into 75 Ω . load	No input signal	11
PIX MON intensification (bright-up)		During line select only. Active video of selected lines has a DC offset of approximately 180 mV.	
PIX MON output impedance		75 Ω. (nominal)	
PIX MON return loss (75 Ω)	\leq 30 dB, 50 kHz to 6 MHz	With instrument turned on	19
Input to PIX MON output gain ratio	1:1 ±5% at 15 kHz		11

Table 1–2: DC Restoration

Characteristic	Requirement	Supplemental Information	Step Number
DC restorer clamp time		Back porch	
Frequency response at 60 Hz	Slow: 20% or less Fast: 90% or greater	Attenuation of 60 Hz on input signal	12
Blanking level shift with 10% to 90% APL change	APL changes from 50% to either 10% or 90% will cause blanking level shift of 1 IRE unit (7.14 mV) or less.		12
Blanking level shift due to presence or absence of burst	1 IRE unit (7.14 mV) or less shift from no color burst to presence of color burst.		12

Table 1–3: Calibrator

Characteristic	Requirement	Supplemental Information	Step Number
Frequency	100 kHz ±100 Hz	Synchronizes in 2H and 1H sweeps. Crystal controlled. Timing accuracy is 10 μ s, ± 0.01 μ s. Can be used as 10 μ s and 1 μ s timing calibrator.	3
Amplitude	140 IRE (1 V) within 1%		10
Position		Top of waveform must be between 80 IRE (0.86 V) and 120 IRE (1.14 V) on graticule when backporch is positioned to 0 IRE (0.300 V) line, with DC RESTORER on.	

Table 1-4: Horizontal Deflection System

Characteristic	Requirement	Supplemental Information	Step Number
Sweep	Sweep occurs in all horizontal mode settings with or without synchroniza- tion.		5
2FLD sweep repetition rate	Equal to frame rate of applied video or external sync		
2FLD sweep magnification		Approximately X25	

Characteristic	aracteristic Requirement		Step Number	
1LINE sweep repetition rate	Equal to line rate of applied video or external sync			
2LINE sweep repetition rate	Equal to half line rate of applied video or external sync			
Sweep length		2LINE and 2FLD sweep length is nominally 12.5 divisions.		
Timing accuracy		All timing and linearity specifications exclude the first and last major divisions of the unmagnified display. Timing can be adjusted ±5% with front-panel H CAL.		
10 μs/div. (2LINE) sweep accuracy	Within 2%		6	
5 μs/div. (1LINE) sweep accuracy	Within 2%		6	
0.2 μs/div. (1LINE + MAG) sweep accuracy	Within 2%		6	
Integral linearity	Within 1%	Measured between the 10 ms and 110 ms points on the 10 ms/division sweep. Calibrator transitions fall exactly on graticule marks.	6	
Sweep magnifier registration		Magnification occurs about center of screen		
HORIZONTAL position	Any portion of a synchronized video sweep can be positioned on screen in all sweep modes.			

Table 1–4: Horizontal Deflection System (Cont.)

Characteristic	Requirement	Supplemental Information	Step Number
LINE SELECT	Displays the selected line in 1LINE. Displays the selected line first in 2LINE. Intensifies selected line in 2FLD. In 15LINE, displays overlayed lines in 1 or 2LINE, intensifies the selected 15 lines in 2FLD. A small 15 is added to the bottom of the CRT readout in 15LINE mode.		
Readout		NTSC: Field 1: Lines 1 to 263 Field 2: Lines 1 to 262 All: Lines 1 to 262 PAL Field 1: Lines 1 to 313 Field 2: Lines 314 to 625 All: Lines 1 to 312	
		PAL-M Field 1: Lines 1 to 263 Field 2: Lines 264 to 525 All: Lines 1 to 262	

Table 1-4: Horizontal Deflection System (Cont.)

Table 1–5: Synchronization

Characteristic	Requirement	Supplemental Information	Step Number
Input requirements, internal reference NTSC and PAL–M	Composite video or black burst with sync amplitudes 40 IRE ± 6 dB		4
PAL	Composite video or black burst with sync amplitudes 300 mV \pm 6 dB		4
External reference	Sync amplitude between 143 mV and 4 V will synchronize sweeps		4
External reference, DC input imped- ance (unterminated)		Greater than 15 k Ω	
Return loss (75 Ω)	At least 40 dB from 50 kHz to 6 MHz	Loop-through terminated in 75 $\Omega_{\text{,}}$ instrument power on or off	19
Absolute maximum input voltage		±12 VDC plus peak AC	

Table 1–5: Synchronization (Cont.)

Characteristic	Requirement	Supplemental Information	Step Number
Remote sync Amplitude	2.0 to 5.0 V square wave, or 4.0 V comp sync	Input and enabled through rear-panel REMOTE connector. Input Impedance 1 M Ω . 30/60 Hz (25/50 Hz) square wave will sync 2FLD Sweep. Remote sync bypasses the sync stripper and field ID circuits.	
Sweep trigger polarity		Internal jumper selects polarity. Normal: Negative-going edge line sync, positive edge of field sync. Inverted: Positive-going edge line sync, negative edge of field sync.	
90/100 Hz triggering amplitude		2.0 to 5.0 V square wave	
90/100 Hz triggering frequency	NTSC: 90 Hz ±15% PAL: 100 Hz ±15%		9

Table 1-6: RGB/YRGB Mode

Characteristic	Requirement	Supplemental Information	Step Number
RGB/YRGB	Will display either a 3-step or 4-step RGB/ YRGB parade or overlay display.	Internal jumper is used to change from 3-step to 4-step capability. Factory set to 3-step.	7
Staircase amplitude	A 10 V input will result in a horizontal display of 9 divisions ± 1.4 major divisions.	Internal adjustment offsets any incoming signal DC component between ± 12 V. Input impedance 1 M Ω shunted by approx. 3 pF.	7
Sweep repitition rate	Field or line rate of displayed video or external sync signal as selected by front-panel HORIZONTAL controls.	Field or line rate, if enabled from the REMOTE connector.	7
Control		RGB/YRGB mode and parade/overlay selected by applying ground (TTL low) at the RGB enable pin on the rear-panel REMOTE connector. RGB components may be overlayed with normal sweep length by not activating RGB enable.	
Magnifier		Approx. X25 for 2FLD, and X10 in 1 or 2LINE.	
Sweep length	3-step: 3.4 — 4.1 divs 4-step: 2.5 — 3.1 divs	Field or line rate sweeps. A 1FLD sweep is selected by grounding the 1FLD/1LINE pin of the rear-panel REMOTE connector.	7

Table 1–7: CRT Display

Characteristic	Requirement	Supplemental Information
CRT viewing area		80 X 100 mm Horizontal = 12.5 div Vertical = 170 IRE units (1.19 V)
Accelerating potential		Nominally 13.75 kV
Trace rotation range	Greater than $\pm 1^{\circ}$ from horizontal	Total adjustment range is typically 8°
Graticule		Internal, variable illumination

Table 1–8: Power Source

Characteristic	Requirement	Supplemental Information
Mains voltage range	90 – 250 V	Continuous range from 90 to 250 VAC
Mains frequency		50 or 60 Hz
Power consumption		56 VA (35 Watts)

Table 1–9: Environmental Characteristics

Characteristic	Requirement
Operating temperature	0 to 50 °C (+32 to 122 °F)
Storage temperature	-40 to 75 °C (-40 to 158 °F)
Operating altitude	To 15,000 feet (4572 meters)
Storage altitude	To 50,000 feet (15,240 meters)
Vibration	5 minutes at 5 - 15 Hz with 0.060 inch displacement. 5 minutes at 15 - 25 Hz with 0.040 inch displacement. 5 minutes at 25 - 55 Hz with 0.020 inch displacement. Military Specification: Mil-T-28800D, Paragraph 1.2.2, Class 3.
Mechanical shock	Non operating: 50 g's 1/2 sine, 11 ms duration, 3 shocks per surface (18 total).
Transportation	Qualified under NSTA Test Procedure 1A, Category II (24 inch drop).
Humidity	Will operate at 95% relative humidity for up to five days. Do not operate with visible moisture on the circuit boards.

Category	Standards or Descriptio	n
EC Declaration of Conformity – EMC ¹		39/336/EEC for Electromagnetic Compatibility. Compliance was wing specifications as listed in the Official Journal of the European Union:
	EN 50081-1 Emissions: EN 55022 EN 50082-1 Immunity: IEC 801-2 IEC 801-3 IEC 801-4	Class B Radiated and Conducted Emissions Electrostatic Discharge Immunity RF Electromagnetic Field Immunity Electrical Fast Transient/Burst Immunity
	 High-quality shielded standards. 	cables must be used to ensure compliance to the above listed
	This product complie enclosures:	es when installed into any of the following Tektronix instrument
	1700F02 P	Standard Cabinet Portable Cabinet Rack Adapter
Australia/New Zealand Declaration of Conformity – EMC	Complies with EMC provis	sion of Radiocommunications Act per the following standard(s):
	AN/NZS 2064.1/2	Industrial, Scientific, and Medical Equipment: 1992
	AN/NZS 3548	Information Technology Equipment: 1995
FCC Compliance	Emissions comply with FC	CC Code of Federal Regulations 47, Part 15, Subpart B, Class A Limits.
Installation (Overvoltage) Category	Terminals on this product installation categories are	may have different installation (overvoltage) category designations. The :
		el mains (usually permanently connected). Equipment at this level is ed industrial location.
		ns (wall sockets). Equipment at this level includes appliances, portable ar products. Equipment is usually cord-connected.
	CAT I Secondary (sigr	nal level) or battery operated circuits of electronic equipment.
Pollution Degree	A measure of the contaminates that could occur in the environment around and within a product Typically the internal environment inside a product is considered to be the same as the external Products should be used only in the environment for which they are rated.	
	Pollution Degree 1	No pollution or only dry, nonconductive pollution occurs. Products in this category are generally encapsulated, hermetically sealed, or located in clean rooms.
	Pollution Degree 2	Normally only dry, nonconductive pollution occurs. Occasionally a temporary conductivity that is caused by condensation must be expected. This location is a typical office/home environment. Temporary condensation occurs only when the product is out of service.
	Pollution Degree 3	Conductive pollution, or dry, nonconductive pollution that becomes conductive due to condensation. These are sheltered locations where neither temperature nor humidity is controlled. The area is protected from direct sunshine, rain, or direct wind.

Table 1–10: Certifications and Compliances

Category	Standards or Description	
	Pollution Degree 4	Pollution that generates persistent conductivity through conductive dust, rain, or snow. Typical outdoor locations.
Safety Standards

Operating Instructions

Section 2 Operating Instructions

These instructions provide information about the front–panel controls, rear– panel connectors, graticules, and an Operator's Familiarization / Checkout Procedure, along with measurement discussions.

Front–Panel Controls and Indicators

The front-panel controls and indicators consist of momentary contact push-button switches, variable controls, and backlit switch selections. See Figure 2-1 for control and indicator locations. When Line Select is being used, the field and line numbers are displayed on the CRT for field rate sweeps; a strobe pulse is applied to displays of 2 field rate sweep to identify the selected line.

There are eight push–button switches that have functions that are accessed by holding the switch down for approximately one second. These functions are identified by a blue box surrounding the front–panel label. The DC Restorer switch toggles between FAST and SLOW when it is pushed and held. When exiting a held mode the selection reverts to the top of the list at the touch of the push button, with the exception of the REF switch, which returns to its previous setting.

1 INPUT FILTER

Toggles through three positions, FLAT, LPASS, and CHROMA. In 2LINE or 2FLD SWEEP a combination filtering routine, consisting of Low Pass and Flat for alternate lines or fields, can be accessed by holding the FILTER push button switch in. In the dual filter mode the low pass filtered line or field will always be on the left in 2LINE or 2FLD SWEEPs. Lines are overlayed in 1LINE SWEEP. The dual filter can not be accessed when the 1730–Series is in AB switching or Line Select mode.

Filtering always returns to FLAT when coming out of the combination filtering routine. If AB switching or LINE SELECT is selected after the dual filter mode, filtering will be low pass.

2 REF

Toggles between internal and external reference. Calibrator is accessed by holding in the REF switch. Instrument status is retained in memory when CAL is selected and the original status restored when the push button is again pushed. All front–panel lights, except SWEEP and MAG, go out and GAIN goes to X1 when the calibrator is selected. The X5 and VAR GAIN are usable with the

Figure 2-1: 1730–Series front–panel control locations. Front panels are identical for the 1730 and 1731. Inserted CRT panel identifies the different switch functions for the 1735.

3 СН-А-СН-В

Switch that toggles between Channel A and Channel B input. When held, the 1730–Series goes into an AB (BOTH) alternate mode, with the A input on the left and the B input on the right in 2 Line or 2 Field (lines are overlayed in 1 Line sweep). When in the AB switching mode the REF is forced to EXT, the FILTER is forced to LPASS, if it was in the LPASS–FLAT switching mode; if not the FILTER remains in the previous position, and the DC REST goes to SLOW. All three functions go back to their previous setting when the input is switched out of AB. The DC Restorer can be changed after entering the AB mode. When leaving (BOTH), the input always returns to CH–A.

4 GAIN (control)

Enabled when the GAIN switch is in VAR. Adjusts amplifier input gain rate to make any input waveform signal, between 0.8 and 2.0 V peak–to–peak a full–scale display. Control has no detent.

5 VERTICAL GAIN (Switch)

Toggles between VAR, X5, and off. A BOTH mode consisting of VAR and X5 is accessed by holding the push button until both LED indicators are lit.

6 DC REST

Toggles the DC Restorer on and off. When turned on the restorer comes up as previously selected, in either the SLOW or FAST position. Pushing and holding the switch in toggles the restorer between FAST and SLOW. Once the restorer speed has been selected, pushing the DC REST button turns the DC Restorer on, at the selected speed, or off.

7 POSITION

Variable control that positions the waveform display vertically.

Horizontal

8 SWEEP

Toggles between 2LINE and 2FLD Sweep. 1LINE Sweep is accessed by holding the SWEEP push button in until recognition occurs. The MAG is automatically turned off if SWEEP is changed. Sweep rates are as follows:

2LINE unmagnified = $10 \,\mu$ s/div

1LINE unmagnified = $5 \,\mu s/div$

9 MAG

Toggles between on and off. Operates in conjunction with the SWEEP mode to provide usable sweep rates as follows:

2LINE + MAG = $1 \mu s/div$ 2FLD + MAG = 1 full vertical interval 1LINE + MAG = $0.2 \mu s/div$

The vertical interval displayed in 2FLD MAG is the one following the selected field trigger; for example, if FLD 1 is selected as the trigger, the vertical interval displayed is the one between field 1 and field 2 (field 2 interval).

10 FIELD

Toggles between FLD 1 and FLD 2. The ALL mode is accessed, in the LINE SELECT mode, by holding the FIELD push button in until the word ALL appears on the CRT readout for 2LINE or 1LINE sweep or a bright–up strobe appears in both fields for 2FLD sweep.

This switch determines which field triggers the 2FLD sweep. The selected field trigger is the first (left) field displayed. For example, selecting Field 2 trigger places field 2 on the left, followed by field 1.

In LINE SELECT, the indicator lights go off but triggering of the 2FLD sweep continues on the selected field. A line strobe identifies the selected line. In 1LINE or 2LINE sweep, the FIELD button determines the field from which the selected line is displayed (field 1, field 2, or ALL fields). When exiting ALL fields display, switching defaults to FLD 1.

11 POSITION

Variable control that positions the waveform display horizontally.

Display

12 FOCUS

Adjusts CRT beam for optimum definition.

13 SCALE

Controls the level of graticule illumination.

14 INTENSITY

Controls display brightness.

Power

15 ON

Switches between instrument in a powered up state and in standby. Portions of the power supply circuit board still have mains potential on them. A mechanical indicator in the center of the switch shows the status of the POWER switch.

WARNING. Power Supply Hazard:

Mains power is still applied to the 1730–Series power supply circuit board, regardless of POWER switch state. To totally remove shock hazard it is necessary to unplug the instrument and wait for capacitors to discharge.

Line Select

16 ON

Toggles between ON and OFF. Line and field number are displayed on the CRT in 1LINE or 2LINE sweep rates with a colon as a delimiter, for example: F1:19 (field 1, line 19). In LINE SELECT mode, the selected line is displayed in 1LINE sweep rate, the selected line is displayed first in the 2LINE sweep rate, and a bright–up is provided to mark the selected line in 2FLD sweep rate. The field from which the line will be displayed can be selected with the FIELD switch.

15 LINE display is accessed by holding the LINE SELECT ON button until there is recognition. In 2FLD, the 15 lines are intensified in the display. In 1 or 2LINE sweeps, the 15 lines are overlayed and the CRT readout is active, giving the field and line of the first displayed line plus a small 15 immediately below the colon in the readout.

Lines displayed in the LINE SELECT mode have their active video intensified on the PIX MON OUT signal.

17 UP

Increments the line count (when enabled). Holding the UP push button in increments faster.

18 DOWN

Decrements the line count (when enabled). Holding the DOWN push button in decrements faster.

Holding either button down until the count passes the beginning or end of the field causes the count to shift to the other field.

(When LINE SELECT is enabled, holding in both the UP and DOWN push buttons returns the line count to Field 1, Line 19.)

Recall Setup

19 STORE

Enables the storage of front-panel settings, including line number, in four different memory locations. To Store a front-panel setup, the STORE switch is pushed and then one of the four RECALL SETUP switches is pushed. When STORE is pushed, all front-panel lights cycle off and on (approximately 15 times) to indicate that the front-panel, as it is currently set up, can be Stored. If the current selection is not the desired setup, pushing any front-panel button, except a RECALL SETUP, will cancel the STORE mode. If one of the RECALL SETUP switches is pushed while STORE is active, the current front-panel setup will be stored in the selected RECALL position. CAL cannot be Stored.

When a Store operation is performed on the 1735, the selected standard (50 Hz, 60 Hz, or AUTO) is stored.

20 RECALL SETUP (1-2-3-4)

Recalls from memory, or causes the storage in memory of a (1-2-3-4) front– panel setting. Each of the four switches operates with a memory location and the STORE push–button switch.

A special feature in the 1735 allows the operator to use the Store and Recall function in the normal manner, or to select from three operating modes by holding the RECALL switches. The 50 Hz (PAL) standard of operation is selected by holding the Recall Setup 1 button and 60 Hz is selected with the Recall Setup 2 button. AUTO, which provides automatic switching between the two standards, is selected with the Recall Setup 3 button. In non–line select modes of operation, holding the Recall Setup 4 button will display the status of the current standard.

If 50 Hz or 60 Hz operation has been Stored as a setup, it will be recalled by pushing a RECALL switch. If the AUTO mode of operation is Recalled, and a change in input signal standard has occurred, the 1735 will recall the correct

standard (after the slight delay associated with automatic determination of the reference standard).

Miscellaneous

21 ROTATE

A 270° screwdriver adjustment that aligns the display with the graticule.

22 V CAL

A 270° screwdriver adjustment that sets the vertical amplifier gain. Is normally used with the CAL position of the REF switch.

23 H CAL

A 270° screwdriver adjustment that sets the timebase. Can be used accurately with the CAL position of the REF switch in the 2H Sweep.

24 READOUT

A 270° screwdriver adjustment used to change the brightness of the readout portion of the CRT display relative to the waveform intensity.

Rear-panel Connectors

Signal input, power input, RGB input, Remote Sync Input, Picture Monitor Out, Auxiliary Control Output, and Remote Control are all located on the 1730–Series rear panel. Because of the similarity of the 1730– and 1720–Series rear panels, WAVEFORM MONITOR is printed on the 1730–Series rear panel. See Figure 2-2 for the locations of the rear–panel connectors.

Bnc Connectors

1 CH–A

Bridging loop–through composite video input, compensated for 75 Ω . This input is selected for display by the front–panel INPUT switch.

2 CH-B

Bridging loop–through composite video input, compensated for 75 Ω . This input is selected for display by the front–panel INPUT switch.

Figure 2-2: 1730–Series rear panel.

3 EXT REF

Bridging loop–through synchronization input (compensated for 75Ω), selected as the synchronizing source by the front–panel REF switch. The input signal may be composite sync, black burst, or composite video.

4 PIX MON OUT

A 75 Ω , unfiltered, output signal that corresponds to the front-panel selected display. This signal has bright-up, in the LINE SELECT mode, and is used to drive a picture monitor.

Multi-Pin Connectors

5 REMOTE

A 15-pin, D-type, female connector that provides limited remote control functions, such as four factory-preset front-panel setups, store disable, and the input connector and enable for the RGB/YRGB staircase.

Remote functions are activated by polled ground closure; only changes in remote input are responded to, allowing the front panel to be fully operational.

6 AUXILIARY CONTROL OUT

A 9–pin, D–type, female connector to interface with the 1720–Series. Auxiliary control consists of a signal line and an interface bus. The bus provides the 1730–Series with control of the 1720–Series Vectorscope.

Power Input

7 AC FUSE

Holder for the instrument's mains fuse.

8 AC POWER

A standard ac plug receptacle for 120 or 240 Vac power mains. Plug is compatible with any of the three power cord options available for the 1730–Series Waveform Monitor.

9 DC INPUT

A knockout for installation of a 1700F10 Field Upgrade Kit dc power plug.

Operator's Checkout Procedure

The following procedure is provided as an aid in obtaining a display on the 1730–Series Waveform Monitor (operator familiarization), and as a quick check of basic instrument operation. Only instrument functions, not measurement quantities or specifications, are checked in this procedure. Therefore, a minimum amount of test equipment is required. All checks are made with the cabinet on and all internal jumpers in the factory–set position.

If performing the Operator's Checkout Procedure reveals improper operation or instrument malfunction, first check the operation of associated equipment. If associated equipment is performing normally, refer the 1730–Series Waveform Monitor to qualified service personnel for repair or adjustment.

When a complete check of the instrument performance to its specification is desired, refer to the Performance Check (which should only be performed by qualified service personnel) in Section 5 of this manual.

This procedure requires a source of composite video. The TEKTRONIX 1410–Series Television Test Signal Generator (1410 for NTSC, 1411 for PAL, or 1412 for PAL–M) with Sync, Color Bar, and Linearity modules was used in preparing this procedure.

Procedure This procedure requires only one hook–up to perform. Figure 2-3 shows the required connections. Once the connections are made, continue on to step 1 of the procedure.

Figure 2-3: Equipment connections for the 1730–Series "Operator's Checkout Procedure."

75% Ampl. 7.5% Setup - NTSC and PAL-M

75% Ampl. 0% Setup – PAL

Modulated Staircase

(Flat Field, 5 Step)

2. Apply Power

Connect the instrument to a suitable ac power source and push the POWER button. A center dot should appear in the eye of the POWER switch to indicate that it is on.

NOTE. Front-panel screwdriver adjustments:

Do not set any of the front-panel screwdriver controls until after the instrument warms up (20 minutes minimum).

DC REST	OFF	
SWEEP	2LINE	
MAG	OFF (no indicators on)	
LINE SELECT	OFF (no line number readout on CRT)	
FIELD, HORIZONTAL POSITION, FOCUS, SCALE, INTENS, DOWN, UP, and RECALL SETUP all as they are.		
Screwdriver adjustments (ROTATE, V CAL, H CAL, and READOUT) should not be adjusted until directed in procedure.		

POWER ON

4. Obtain Display

Adjust the INTENS and FOCUS controls for the desired brightness and a welldefined display. Adjust the multi-turn VERTICAL Position control to place the display blanking level on the graticule 0 IRE (NTSC and PAL–M) or 300 mV (PAL) line. Center the display with the HORIZONTAL Position. See Figure 2-4.

Figure 2-4: Two-line color bar display in FLAT filter mode.

Adjust the SCALE illumination control for the desired graticule scale brightness.

5. Check the Rotation of the Display

Variations in the earth's magnetic field may make adjustment of the ROTATE control necessary at installation time or whenever the instrument is moved.

Check that the display blanking level is parallel to the horizontal axis. If not, adjust the ROTATE screwdriver adjustment until the sweep is parallel to the horizontal axis.

6. Calibrate Display

The CAL mode on the REF switch enables the waveform monitor calibrator signal.

Press and hold the REF button until the CAL indicator LED is lit. Adjust the VERTICAL and HORIZONTAL Position controls to obtain a display similar to that shown in Figure 2-5.

If necessary, adjust the V CAL screwdriver control for 1 V amplitude (140 IRE). Switch REF to INT mode.

Figure 2-5: Checking vertical gain calibration with the 1730–Series internal calibrator (CAL) reference.

7. Select Input

The AB switch selects the rear-panel Channel A or Channel B inputs. Position the color bar waveform so that the blanking level is at the -40 IRE (0 V) graticule line and the sync pulses are at each end of the graticule.

Select the Channel B input. Note that the linearity waveform is displayed.

Push and hold the INPUT button until both the color bar and linearity waveforms are displayed. See Figure 2-6. Check that both the CH–A and CH–B front–panel indicators are on.

Push the switch to return to the Channel A (color bar) display.

Figure 2-6: Dual channel, 2-line display of color bar and linearity signals.

8. Select Timing Reference

Be sure that SWEEP is still 2LINE. Hold the REF button in until the CAL signal appears. Position it so the top of the display is on the 70 IRE (NTSC and PAL–M) or 0.7 V (PAL). Horizontally position the display so the first transition is on the left side timing mark (the mark that goes completely through the blanking line. There are three on the graticule.) See Figure 2-7a. Check that the falling transition of the 10th square wave passes directly through the right side timing mark. The H CAL can be adjusted if timing is off. Push the MAG button and check for one cycle of square wave over the 10 divisions of timing area. See Figure 2-7b.

Hold the SWEEP button until the 1LINE front–panel indicator lights. Check for five full cycles over the 10–division timing area. See Figure 2-7c.

Push the waveform monitor REF switch and return to INT.

9. Gain Control

The normal GAIN setting (with the GAIN switch off) is 1 V full scale with neither the X5 nor the VAR indicator lit. The GAIN (VAR) control changes the amplifier gain so that signals greater or lesser in amplitude to the calibrated 1 volt full scale can be displayed as full scale.

Figure 2-7: Checking timing with the internal calibrator signal: a) 2–line display. b) 2–line display magnified. c) 1–line display.

Push the GAIN switch and note that the VAR indicator is lit. Also note the range of amplitude (signal amplitude greater than the scale at one extreme and considerably smaller at the other) that is obtained with the control.

Push the button and check that the X5 indicator lights. Check for a large increase in gain. (It can be determined that this is a X5 gain increase by setting the signal base line on the graticule 0 IRE (NTSC and PAL–M) or 300 mV

(PAL) and checking that the maximum excursion of color burst is at approximately the 100 IRE or 1 V graticule line.)

Push the button in and hold it until both the VAR and X5 indicators are lit. Rotate the GAIN control and look for a greater than 5X amplitude display at one extreme and a nearly normal amplitude display at the other extreme.

Push the GAIN button once and notice that the display amplitude returns to 1 V Full Scale.

10. Filter Selection

The FILTER button selects the frequency response characteristic for the displayed signal. The FLAT response is used for normal applications. Figure 2-4 shows the color bar signal with the FLAT response.

Figure 2-8: Two-line display of color bar signal with LOW PASS filter on.

Press and hold the FILTER button to get the front–panel LPASS indicator to light. This provides the low pass frequency response; the chrominance component of the signal has been removed. See Figure 2-8.

Figure 2-9: Two-line display of color bar signal with CHROMA filter.

Press the FILTER button once more and look to see that the CHROMA indicator is lit. The signal is now displayed as chrominance only; the luminance component is removed. See Figure 2-9.

Figure 2-10: Two–line display with dual filter selected (LOW PASS and FLAT).

Hold the FILTER button in until both the FLAT and LPASS front-panel indicators are lit. The display now consists of two lines, the first of which has the chrominance removed and the second is unfiltered. See Figure 2-10.

Push the FILTER switch and return to FLAT.

11. Sweep Speeds and Line Select

Turn on LINE SELECT and push and hold both the UP and DOWN buttons until the readout indicates that line 19 of field 1 is being displayed. Use the LINE SELECT UP or DOWN button to display line 131 (see Figure 2-11). Holding in the UP or DOWN button causes the counter to move faster.

Figure 2-12: Two–field display with intensified line in the first displayed field.

Push the sweep button and observe the 2FLD Sweep with an intensified line at the mid point of one of the fields (see Figure 2-12). This intensified line is located at the line just viewed in the 2–line display. Push and hold the LINE SELECT button until the intensified portion of the display increases in width; this is the 15 Line mode of LINE SELECT. See Figure 2-13.

Figure 2-13: Two-field display with 15 line mode of the LINE SELECT on.

Figure 2-14: A 1–line sweep rate with 15 continuous lines (from mid field) displayed using LINE SELECT.

Push and hold the SWEEP button until the front-panel 1LINE indicator lights. Look for a display of one line, with a readout that shows F1 or F2:131 over 15 (see Figure 2-14). This is the 15 continuous lines which were intensified in the 2-field display, overlayed in a one-line display. The readout shows that these 15 lines are in field 1 or field 2, starting with line 131. Change the field by pushing the FIELD button. Turn off LINE SELECT.

Figure 2-15: Display of vertical interval with magnified 2 field sweep.

12. Horizontal Magnifier

Select the 2LINE SWEEP and center the horizontal sync on the screen. Press the MAG button and note the magnification of the horizontal sync details. Push SWEEP for 2FLD and MAG for X25 and note that the vertical interval is displayed. See Figure 2-15. Note that the MAG button works with any SWEEP selection. Push the MAG button to turn off the MAG.

13. Recall Setup

Set the 1730–Series for both CH–A and CH–B input, SWEEP to 1LINE, MAG on, and VERTICAL GAIN to X5. Note front–panel indicators. Push the RECALL SETUP 1 button and note that the front–panel setup changes.

NOTE. Do not attempt to STORE:

The Store function could also be checked; however, operating settings may be stored in the memory location, and they would be overwritten with the new front-panel information. For more information on how to use the Store function, see CONTROLS and CONNECTORS in this section of the manual.

Graticules

	There are three basic graticule patterns available for the 1730–Series. All three are internal with edge illumination. The graticule used by both the 1730 and the 1731 PAL–M is a 525 line/60 Hz NTSC Composite scale. The 1731 PAL has the CCIR 625 line/ 50 Hz graticule for the PAL color standard. The 1735 has a dual graticule which accommodates both NTSC and PAL scales.	
	Because the internal graticule is on the same plane as the CRT phosphor it eliminates viewing and photographic parallax errors. The graticule is illumi- nated, using a front-panel SCALE adjust control, so that the level of graticule brightness can be adjusted to optimum for viewing or photographing needs.	
	The major differences between the NTSC and PAL graticules are in the vertical scales. In the paragraphs that follow each of the vertical graticule scales will be discussed separately, while the horizontal scales are discussed together.	
NTSC Composite Video Graticule Vertical Scales	The NTSC graticule has two main vertical scales to facilitate typical measurements. See Figure 2-16. The left side scale is marked in IRE units and extends from -50 to $+120$ IRE in 10 IRE increments. An IRE unit is equal to 7.14 millivolts. Black level setup is denoted by a dashed line at 7.5 IRE.	

Figure 2-16: NTSC graticule.

There are ± 2 IRE and ± 4 IRE markings at the center of the -40 IRE line (sync tip) to assist in measuring sync amplitude. This scale is designed to be used with the 2 line and 2 field sweep rates.

The scale on the right side of the graticule is for measuring depth of modulation. The scale extends from 0% at the 120 IRE line to 100% at sync tip (-40 IRE line).

The boxed area slightly to the right of center at the 100 IRE level is scaled in 2% and 4% increments for precise tilt measurements. This structure is designed to work with an 18 μ s half–amplitude duration (HAD), 2T bar. The set of solid and short dashed lines to the left of the bar tilt measurement structure is used to measure pulse–to–bar ratio; they are weighted to include K–Factor ratings of 2% and 4%.

Making Measurements. To use the NTSC vertical scale to make line time distortion and pulse–to–bar ratio measurements, set the signal blanking level at the graticule blanking line (0 IRE) and position the leading edge of the Composite Test Signal bar to the ascending arrow (just right of graticule center). Check to see if insertion gain is unity. If it is not, adjust the 1730–Series VAR for exactly 100 IRE of signal amplitude from baseline to the middle of the white bar. Check to see that the negative–going bar transition passes through the descending arrow.

To measure the K–Factor line time distortion, measure the largest deviation of the bar top (tilt or rounding) within the structure. The structure is designed to ignore the first and last 1 μ s of the bar where short–time distortions (ringing, overshoot, undershoot, etc.) occur. The solid outer box equals a 4% K–Factor, while the dashed line inner box equals a 2% K–Factor. (For signals with a bar

HAD that exceeds $18 \,\mu$ s, simply measure the bar top in increments by positioning the bar to the left or right from the leading or trailing edge. Note that when the leading or trailing edge is on the appropriate arrow, the first or last $1 \,\mu$ s is automatically excluded from the measurement.)

Pulse–to–bar K–Factor measurements are made using the solid and short dashed lines to the left of the line time distortion structure. These lines are scaled according to the following formulas:

$\frac{1}{(1-4K)}$ and $\frac{1}{(1+4K)}$			
	Where: K=0.02 for 2% K–Factor (dashed lines) K=0.04 for 4% K–Factor (dashed lines)		
	Calibrated 5X Gain increases resolution to 0.4% and 0.8%.		
	This scaling is described in detail in CCIR Standard Volume 5, 1966.		
	Make sure that the center of the bar is at 100 IRE when blanking level is at 0 IRE (use VAR to adjust gain, if necessary). If necessary, use the HORIZON-TAL Position control to place the 2T pulse over the measurement area and measure its amplitude. The top of the pulse falling within the dashed lines equals less than 2% K-Factor.		
Horizontal Scales for NTSC and PAL Graticules	The Horizontal reference line is the baseline at 0 IRE (NTSC and PAL–M) or 0.3 V (PAL). This timing line is 12 divisions long on NTSC graticules (12.4 divisions for PAL), and takes on different timing intervals depending on the sweep rate selected. In 2 line sweep each major division is 10μ s, and when magnified (X10), each major division equals 1μ s. In 1 line sweep each major division is equal to 5μ s, and when magnified (X25) each major division equals 0.2μ s. In 2 field sweep the timing scale is of no real value, since this is a monitoring mode; however when 2 field sweep is magnified (X25) the entire vertical (field) interval can be displayed.		
PAL Graticule Vertical Scales	The PAL graticule scales are from 0 to 1.2 V on the left side. See Figure 2-17. The right side has markings at sync tip (-0.3 V) , baseline (0 V) , and peak white $(+0.7 \text{ V})$. There are 2% and 4% markings at the horizontal center of the graticule on the 0 V line (sync tip level) to assist in measuring sync amplitude. The dashed horizontal line at the top of the graticule is equal to 1.234 V to indicate peak amplitude of 100% color bars.		

Figure 2-17: PAL graticule.

The boxed area slightly to the left of center at the 1.0 V level is scaled for 2% and 4% K–Factor ratings for precise tilt measurements. This structure is designed to work with an 8 μ s, half–amplitude duration (HAD) bar. The short dashed lines to the right of the bar tilt measurement structure are used to measure pulse–to–bar ratio; they are weighted for 2% and 4% K–Factor ratings.

There are 2% and 4% markings near the horizontal center of the graticule on the 0 V line (sync tip level) to assist in measuring sync amplitude. The dashed horizontal line at the top of the graticule is equal to 1.234 V to indicate peak amplitude of 100% color bars. Between the 0.9 V and 1.1 V lines, there are markings at 20 mV intervals.

Making Measurements. To use the PAL vertical scale for measuring the K–Factor for line time distortion and pulse–to–bar ratio measurements, set the signal blanking level at the graticule blanking line (0.3 V) and position the leading edge of the bar to the ascending arrow, just right of graticule center. Check to see if insertion gain is unity. If it is not, adjust the 1730–Series VAR for exactly 0.7 V of signal amplitude from baseline to middle of the white bar. Check to see that the negative–going bar transition passes through the descending arrow.

To measure the K–Factor for line time distortion, measure the largest deviation of the bar top (tilt or rounding) within the structure. The structure is designed to ignore the first and last 1 μ s of the bar where short–time distortions (ringing, overshoot, undershoot, etc.) occur. The solid outer box equals a 4% K–Factor, while the dashed line inner box equals 2% line time K–Factor. (For signals with a bar half–amplitude duration (HAD) that exceeds 8 μ s, simply measure the bar

top in increments by positioning the bar to the left or right from the leading or trailing edge. Note that when the leading and trailing edge is on the appropriate arrow, the first or last $1 \,\mu$ s is automatically excluded from the measurement.)

Pulse–to–bar K–Factor measurements are made using the solid and short dashed lines to the right of the line time distortion structure. These lines are scaled to the following formulas:

$$\frac{1}{(1-4K)}$$
 and $\frac{1}{(1+4K)}$

Where: K=0.02 for 2% K–Factor (dashed lines) K=0.04 for 4% K–Factor (dashed lines)

Calibrated 5X Gain increases resolution to 0.4% and 0.8%.

This scaling is described in detail in CCIR Standard Volume 5, 1966.

Make sure that the center of the bar is at 100 IRE when blanking level is at 0 IRE (use VAR to adjust gain, if necessary). If necessary, use the HORIZON-TAL Position control to place the 2T pulse over the measurement area and measure its amplitude. The top of the pulse falling within the dashed lines equals less than 2% K–Factor.

Dual Graticule Vertical
ScalesThe PAL vertical scale, from 0 V to 1.2 V, is provided on the left side of the
1735 graticule. See Figure 2-18. The NTSC vertical scale is provided on the
right side of the 1735 graticule. It extends from -40 IRE to 120 IRE, in 10-IRE
increments. Black level setup is denoted by a dashed line at 7.5 IRE. There are
2-IRE and 4-IRE markings near the horizontal center of the graticule, on the
-40 IRE line (sync tip) to assist in measuring sync amplitude. This scale is
designed to be used with the 2LINE or 2FLD Sweep rates.

Preset Front-Panel Measurements

The 1730–Series has four front–panel setups stored in internal memory. A TTL low (or ground closure) on one of the PRESET enables (pins 12 through 15 of the REMOTE connector) selects one of these pre–programmed, front–panel setups. Table 2–1 shows the preset front panels that are stored in memory.

When the 1730–Series is used as a direct replacement for the TEKTRONIX 528A Waveform Monitor (which used dc voltage levels as enables), it will be necessary to use a conversion circuit to change these positive voltage levels to apparent ground closures. See Figure 3-3 for a simple conversion circuit.

Table 2–1:	Preset Front Panels
------------	----------------------------

Front–Panel Control	Preset 1 (pin 13)	Preset 2 (pin 14)	Preset 3 (pin 15)	Preset 4 (pin 12)
INPUT Channel	А	А	А	А
INPUT Reference	EXT	INT	INT	INT
INPUT Filter	FLAT	FLAT	FLAT	FLAT
VERTICAL Gain (VAR)	off	off	off	off
VERTICAL Gain (X5)	off	off	off	off
VERTICAL DC Restorer	OFF	OFF	SLOW	SLOW
HORIZONTAL Field	FLD 1	ALL	ALL	FLD 1
HORIZONTAL Sweep	2 FLD	2 LINE	1 LINE	2 LINE

LINE SELECT	off	15 LINE	ON	off
LINE SELECT (Line)		100	19	

 Table 2–1: (Cont.)
 Preset Front Panels

RGB/YRGB Display

RGB staircase signals, either 3– or 4–step, are input to the 1730–Series through the rear–panel REMOTE connector. A 10 V input will provide a horizontal sweep length between 7.6 and 10.4 major graticule divisions. An adjustment on the Main circuit board (R856) can be used to adjust for offsets in various staircase signals. RGB sweep is enabled by a TTL low, which can be a ground closure applied to pin 2 of the rear–panel 15–pin connector. (There is a connector drawing in Section 3, Installation, of this manual.) The staircase signal is input through pin 1 of the connector.

Field and line rate displays, controlled by front-panel SWEEP settings, are available. These sweep rates can be magnified (2LINE X10 and 2FLD or 1LINE X25). In addition, a low (ground closure) at pin 3, when 2FLD Sweep is selected, provides a 1 Field Sweep.

Remote Sync

Pin 10 of the REMOTE connector is a remote sync input. A 30 or 60 Hz (25 or 50 Hz for PAL) square wave signal with an amplitude of 2 to 5 volts will trigger the 1730–Series 2FLD Sweep. In addition, a 4 V composite sync signal can also be used as a remote sync signal. Pin 4, when pulled low (TTL low or ground) enables the Remote Sync triggering.

90 Hz (NTSC) or 100 Hz (PAL) Trigger

Pin 10 of the REMOTE connector (REM SYNC IN) is also used as the input for 90 Hz (100 Hz PAL) triggering associated with D2 VTRs. The internal remote Sync Polarity jumper (A3J635) and 90/100 Hz Trigger Enable jumper (A3J540) will have to be moved to accept this trigger signal. See Section 3 (Installation).

When the internal jumpers have been reset and pin 4 (REM SYNC EN) is grounded, the 90 Hz (100 Hz PAL) triggering is enabled. Once the jumpers are enabled and 2FLD SWEEP is selected, a 2 V or greater 90 Hz (100 Hz PAL) square wave, applied to REMOTE connector pin 10 (REM SYNC IN), will trigger a 1–field sweep.

Service Safety Summary

Only qualified personnel should perform service procedures. Read this *Service Safety Summary* and the *General Safety Summary* before performing any service procedures.

Do Not Service Alone. Do not perform internal service or adjustments of this product unless another person capable of rendering first aid and resuscitation is present.

Disconnect Power. To avoid electric shock, switch off the instrument power, then disconnect the power cord from the mains power.

Use Caution When Servicing the CRT. To avoid electric shock or injury, use extreme caution when handling the CRT. Only qualified personnel familiar with CRT servicing procedures and precautions should remove or install the CRT.

CRTs retain hazardous voltages for long periods of time after power is turned off. Before attempting any servicing, discharge the CRT by shorting the anode to chassis ground. When discharging the CRT, connect the discharge path to ground and then the anode. Rough handling may cause the CRT to implode. Do not nick or scratch the glass or subject it to undue pressure when removing or installing it. When handling the CRT, wear safety goggles and heavy gloves for protection.

Use Care When Servicing With Power On. Dangerous voltages or currents may exist in this product. Disconnect power, remove battery (if applicable), and disconnect test leads before removing protective panels, soldering, or replacing components.

To avoid electric shock, do not touch exposed connections.

X-Radiation. To avoid x-radiation exposure, do not modify or otherwise alter the high-voltage circuitry or the CRT enclosure. X-ray emissions generated within this product have been sufficiently shielded.

Warning

The following servicing instructions are for use only by qualified personnel. To avoid personnel injury, do not perform any servicing other than that contained in the operating instructions unless you are qualified to do so. Refer to General Safety Summary and Service Safety Summary prior to performing any service.

Installation

Section 3 Installation

	This section of the manual provides the information necessary to install the 1730-Series monitor in its operating environment. Information contained here provides electrical and mechanical installation, plus settings for the internal jumpers and descriptions of the available, optional cabinets.
Packaging	The shipping carton and pads provide protection for the instrument during transit, they should be retained in case subsequent shipment becomes necessary. Repackaging instructions can be found in Section 6 (Maintenance) of this manual.

Electrical Installation

Power Source	This instrument is intended to operate from a single-phase power source with one current-carrying conductor at or near earth-ground (the neutral conductor). Only the Line conductor is fused for over-current protection. Systems that have both current-carrying conductors live with respect to ground (such as phase-to- phase in multiphase systems) are not recommended as power sources.	
	This section of the manual provides the information necessary to install the 1730-Series monitor in its operating environment. Information contained here provides electrical and mechanical installation, plus settings for the internal jumpers and descriptions of the available, optional cabinets.	
Mains Frequency and Voltage Ranges		
Operating Options		
	Not all installations are identical. In order to make operation of the 1730-Series Waveform Monitor as flexible as possible there are internal jumpers that can be changed to provide operating flexibility. For example, it is possible to select either the 3-step or 4-step parade to accommodate RGB or YRGB displays. With the exception of the 50-60 Hz jumper, the factory preset position is	

indicated by a box printed on the etched circuit board. Table NO TAG details these internal jumper selections. Be sure that all operators are aware of changes, to prevent unnecessary trouble reports, if any of these jumpers are placed in the optional position. See Figure 3-1 for location of the internal plug jumpers.

Figure 3-1: Plug jumper locations and RGB compensation adjustments. Pin 1 is denoted by a small numeral 1 next to the plug jumper symbol.

Table 3–1: Internal Jumper Selections

Jumper Number	Name	Position	Purpose
A3J99	Clamp Enable	1-2 2-3	Not used Standard (factory preset)
A3J197	CH-A Input Coupling	1-2 2-3	AC coupled (factory preset) DC coupled
A3J699	CH-B Input Coupling	1-2 2-3	AC coupled (factory preset) DC coupled

Jumper Number	Name	Position	Purpose
A3J456	RGB/YRGB	2-3	RGB, 3-step parade (factory pre- set)
		1-2	YRGB, 4-step parade
A3J504	50/60 Hz	1-2	50 Hz line rate (factory set for 1731)
		2-3	60 Hz line rate (factory set for 1730) ¹
	(1735 factory set)	1-2	Jumper in 1-2 position or re- moved. ²
A3J540	90 Hz (100 Hz)	1-2	90 or 100 Hz
		2-3	1 Line/1 Field (factory preset)
A3J635	Remote Sync Polarity	1-2	Positive (factory preset)
		2-3	Negative
A3A1	Light Enable	1-2	Lights Enabled (factory preset)
J100		2-3	Lights Disabled

Table 3–1: Internal Jumper Selections

1. 1731 PAL-M requires A3J504 be in the 2-3 position.

^{2.} Having A3J504 in the 2-3 position inhibits the 1735 standard switching.

REMOTE Connector

The rear-panel REMOTE connector is a 15-pin, D-type connector. It is the Remote Control Interface, the input for RGB signals and Remote Sync.

Remote functions, which provide switching and recalling of stored front-panel setups at a remote location, are enabled by ground closures (TTL lows). Functions with "overbars" indicate an active low state. In addition to the four front-panel RECALL SETUPs that can be called up remotely, there are four additional factory-programmed Presets that can only be called up through the REMOTE connector. Pin assignments for the REMOTE connector are shown in Figure 3-2 and discussed in Table 3–2.

Figure 3-2: REMOTE connector pin functions.

Pin	Name	Function/Description
1	RGB Staircase	The RGB Staircase input signal controls the internal sweep ramp to offset the Horizontal in time with the RGB PARADE signal.
2	RGB Enable	Low = RGB Enable. Level sensitive, allows the instrument to process the RGB staircase input.
3	<u>1 LIN, 1 FLD</u>	1 LIN, 1 FLD selection available whenA3W922 is installed, A3W709 is notinstalled, and A3J540 is on pins 2 & 3 (90 HzTrig not enabled). Low = Enable 1 LINE or 1FIELD. 1 LINE if line rate sweep is selected,or 1 FIELD if field-rate sweep is selected.
	PAL	PAL available when A3W709 is installed, A3W922 is not installed, and A3J540 is on pins 2 & 3 (90 Hz Trig not enabled). Low = Enable.
	90 Hz	90 Hz triggering available when A3W922 is installed, A3W709 is not installed, and A3J540 on pins 1 & 2 (90 Hz Trig enabled).
4	REMOTE SYNC EN or 90-100 HZ TRIG EN	Low = Enable Remote Sync. Enables instrument for the Remote Sync input signal or 90/100 Hz Sync input signal on pin 10.

 Table 3–2:
 Remote Connector Pin Assignments and Functions

Pin	Name	Function/Description
5	RECALL 2	Recalls the named user defined front-panel settings from non-volatile memory, when
6	RECALL 3	pulled low (grounded). If more than one pin (5, 6, 7, or 8) is low, the first pin that went low is the one recalled.
7	RECALL 1	
8	RECALL 4	
9	GROUND	Instrument ground for remote control.
10	REMOTE SYNC INPUT	Pin 10 can be used to input Remote Sync or 90 Hz (100 Hz PAL) Sync. Remote Sync is usually a field-rate square wave. It is routed around the Sync Stripper and directly to the Sweep Gating circuitry.
	90 (100) HZ INPUT	90 HZ Sync input signal is a TTL level square wave.
11	STORE	Low = Store disabled. When this line is low, the front-panel STORE button is disabled. Prevents unauthorized changes to the user-defined recalls.
12	FRONT-PANEL PRESET 4	Remotely selects the factory preset front-pan- el settings from memory, when pulled low (grounded). If more than one pin (12, 13, 14,
13	FRONT-PANEL PRESET 1	or 15) is low, the first pin that went low is the one recalled. (Setting is defined in Section 2, "Preset Front-panel Measurements.")
14	FRONT-PANEL PRESET 2	rieset riont-panel measurements.)
15	FRONT-PANEL PRESET 3	

 Table 3–2:
 (Cont.) Remote Connector Pin Assignments and Functions

90 Hz (100 Hz) D-2 Trigger

This function allows the 1730-Series to be triggered by a 2 V, 90 Hz (NTSC) or 100 Hz (PAL) square-wave output from a D-2 VTR. The display is a single field rate sweep selected when the front-panel SWEEP is set to 2FLD. 90 Hz (100 Hz) sweep triggering disables the 1730-Series Remote Sync Input.

The 90 Hz (100 Hz) sweep trigger, when enabled, is input through pin 10 of the rear-panel REMOTE connector. To enable this option (and disable Remote Sync) reposition two internal jumpers:

A3J540 is moved to the 90 Hz (100 Hz) position (1-2).

A3J635 is moved to the Negative Sync Polarity position (2-3).

In addition to resetting the jumpers, a TTL low (ground closure) on the REMOTE connector pin 4 is required to enable this trigger mode.

RGB/YRGB Parade Display

A TTL low level (ground) on pin 2 of the REMOTE connector enables the shortened RGB/YRGB sweep. A 10-volt square-wave input to pin 1 provides approximately 9 divisions of sweep. This sweep can be either 1 line or 1 field depending on front-panel switch setting. The displayed signal is the front-panel selected CH A or CH B input.

When the 1730-Series Waveform Monitor is substituted for a TEKTRONIX 528 or 528A Waveform Monitor, in some applications the +28 V enable signal used by the 528 must be converted to ground closure (0 Vdc). This conversion requires only a few common parts, as shown in Figure 3-3.

Figure 3-3: Common parts used to convert from +28 Vdc enable to ground closure.

RGB Offset and Compensation — Television cameras vary in output dc level; R856 is provided to compensate for this variation in dc level. See Figure 3-1.

C953 is the input compensation that matches the Staircase Amplifier input time constant to the camera output time constant. See Figure 3-1.

Each time the camera input to the 1730-Series is changed the RGB Offset and input time constant will probably need to be reset. The following procedure provides a simple means to make these adjustments.

Procedure for setting RGB Offset

- **1.** Display any standard television waveform. Do not enable the rear-panel REMOTE connector RGB Enable.
- **2.** Use the 1730-Series HORIZONTAL Position control to align the display with the graticule.
- **3.** Ground the REMOTE connector RGB Enable (pin 2) and apply the camera staircase output to the RGB Staircase input (pin 1).
- **4.** Apply the camera video output to the 1730-Series INPUT (CH-A or CH-B) and select that input with the front-panel INPUT selector.
- 5. ADJUST R856 (see Figure 3-1 for location) to center the RGB signal on the graticule.
- 6. ADJUST C953 for the best looking display.

AUXILIARY Connector

The rear-panel AUXILIARY connector is a 9-pin, D-type connector. It is used to control the display on a companion 1720-Series Vectorscope. Line and Field selection information is provided to the Vectorscope over the bus that is contained in this interface. Figure 3-4 and Table 3–3 show the AUXILIARY connector pin assignments.

Figure 3-4: AUXILIARY connector pin functions.

Pin	Function
2-3-4-6	No Connection.
1-5	Ground.
7	External Strobe Out for Line Select blanking output.
8	TXD (Transmit Data) 1730-Series to 1720-Series communication line.

Table 3–3: Auxiliary Control Pin Assignments

Mechanical Installation

- Cabinets
 - All qualification testing for the 1730-Series was performed in a 1700F00 cabinet. To guarantee compliance with specifications, the instrument should be operated in a cabinet. The plain cabinet, 1700F00, is shown in Figure 3-5.

Figure 3-5: Dimensions of the 1700F00 plain cabinet.

The portable cabinet, 1700F02, is shown in Figure 3-6. The 1700F02 has a handle, four feet, a flip-up stand, and is compatible with the TEKTRONIX BP1 battery pack that can be used for a dc power source. The hole sizes and spacing are different from those of the 1700F00.

All of the 1700-Series metal cabinets, which are available from Tektronix as Optional Accessories, provide the proper electrical environment for the instrument. They supply adequate shielding, minimize handling damage, and reduce dust accumulation within the instrument.

Cabinetizing

Do not attempt to carry a cabinetized instrument without installing the mounting screws. Without the mounting screws there is nothing to hold the instrument in the cabinet if it is tipped forward.

The instrument is secured to the cabinet by two 6-32 Pozidrive[®] screws, located in the upper corners of the rear panel. See Figure 3-7.

Figure 3-7: Rear view of the instrument, shown in the cabinet, with the securing screws identified.

Rack Adapter The optional 1700F05 side-by-side rack adapter, shown in Figure 3-8, consists of two attached cabinets. It can be used to mount the 1730-Series and another half-rack width instrument in a standard 19-inch rack.

Figure 3-8: The 1700F05 side-by-side rack adapter.

The rack adapter is adjustable, so the 1730-Series can be more closely aligned with other equipment in the rack. See Figure 3-8.

Figure 3-9: A 1700-Series instrument mounted in a 1700F05 cabinet with a blank front panel (1700F06) covering the unused side of the cabinet.

If only one section of the rack adapter is used, a 1700F06 Blank Panel can be inserted in the unused section. See Figure 3-9. The rack adapter and panel are available through your local Tektronix field office or representative.

In addition to being able to fill the unused side of the side-by-side rack mount cabinet (1700F05) with a blank front panel, an accessory drawer (1700F07) can be installed in the blank side of the cabinet. See Figure 3-10.

Figure 3-10: A 1700F05 side-by-side rack mounting cabinet with an instrument and a 1700F07 utility drawer.

Custom Installation For applications such as consoles, shown in Figure 3-11, the instrument can be mounted with front molding flush or protruding from the console. In both cases, allow approximately 3 inches of rear clearance for bnc and power-cord connections.

To mount the 1730-Series safely, attach it to a shelf strong enough to hold its weight. Install the mounting screws through the four 0.156-inch diameter holes in the bottom of the 1700F00 cabinet. See Figure 3-11.

Figure 3-11: Considerations for custom installation of an instrument.

Theory of Operation

Section 4 Theory of Operation

The material in this section is subdivided into a general description (which is supported by the main block diagram and simplified block diagrams) and detailed circuit descriptions that use the schematic diagrams as illustrations. A thorough understanding of the instrument starts with knowing how the major circuit blocks fit together, which is then followed by an understanding of the individual circuit's functions. These discussions of the 1730-Series Waveform Monitor begin with a brief, fundamental overview, then proceed on to the block diagram, and then go into individual circuit descriptions.

Figure 4-1: Simplified representation of the 1730-Series Waveform Monitor.

Overview

The 1730-Series is a specialized oscilloscope, designed to monitor and measure television baseband signals. See Figure 4-1. Signals input through either of the rear-panel 75 Ω bridging loop-through inputs are synchronously displayed on a CRT. In addition, an alpha-numeric line and field readout is provided on the CRT for use with the LINE SELECT mode of operation.

Front-panel mode switching is accomplished by a series of push-button switches whose status is being constantly polled by a Microprocessor. In turn, the Microprocessor controls switching functions and circuit gains so that the instrument can perform as a monitor or be used to make specific measurements. The Microprocessor is an 8051 type.

The Low Voltage Power Supply is a high-efficiency switching type. The High Voltage Power Supply provides 13 kV acceleration potential.

Block Diagram

The Block Diagram for the 1730-Series Waveform Monitor is located on a foldout in Section 9 of this manual. The following functional description uses the diagram as its illustration. The numbers on the circuit blocks correspond to the schematic diagram where that circuit block is detailed.

Circuit Blocks Vertical — Color-encoded video signals are input through the bridging Channel A and Channel B inputs. The input amplifiers are shunted by sample-and-holdtype clamps, that are timed by a Back Porch Sample from the Back Porch Generator. This clamped signal, prior to any filtering, is also the rear-panel Picture Monitor Output. In LINE SELECT modes, a strobe, that acts as a bright-up pulse, is added to the Picture Monitor Output to identify the selected line (or block of lines in 15 Line). Switching at the output of the amplifiers provides for display of either input signal or a combination of both in all sweep modes. In the combination mode, the Channel A signal is displayed on the left of the CRT with the Channel B following.

Front-panel switching can select a Flat (unfiltered), a Low Pass, or a Chroma filtered signal for display. The low pass filtered signal can be displayed with a Flat (unfiltered signal) as part of the dual filter mode. In dual filter mode, the low pass filtered signal is displayed to the left with the unfiltered (flat) signal following. When the calibrator signal is selected (from the front-panel switching), a 1 volt, 100 kHz signal is applied to the input of the Gain Cell instead of input video. The calibrator signal is used to set up both Vertical Gain (Volts Full Scale) or Horizontal Gain (Sweep rate) from a common, self-contained source.

Signal amplitude can be adjusted at the Gain Cell using either the front-panel V GAIN or VARIABLE gain control. The output signal from the Gain Cell drives another clamped amplifier. This second clamped amplifier has a loop-compensated sample-and-hold circuit to provide the fast clamping required for the Fast DC Restorer. Clamping, as with the first clamp, occurs at back porch time.

The Vertical Positioning voltage, along with the conditioned video signal, is input to a Switchable Gain Amplifier, to provide X5 vertical magnification. Both amplifier gain and positioning range can be increased by a factor of 5 when

X5 Gain is selected at the front panel. The limiter stage that follows prevents overdriving of the Output Amplifier.

The conditioned video signal and the Y component of the Readout (from the Microcontroller) are input to the Vertical Output Amplifier to match impedances and normalize gain (approximately 40 V for 8 cm of vertical deflection) in order to voltage drive the CRT vertical deflection plates.

Horizontal — Composite video from either internal (Channel A or B) or external reference has all active video stripped away by the Sync Stripper to leave only sync to output a sweep trigger. Remote sync, which bypasses the Sync Stripper, triggers the sweep directly when enabled. Remote sync, which is input through the REMOTE connector, requires an external enable.

A jumper determines the polarity of the remote sync for internal triggering: Negative provides line rate triggering off a negative edge and field rate triggering off a positive edge. Positive provides line rate triggering off a positive edge and field rate triggering off a negative edge.

90 Hz (100 Hz for 1731) triggering, for D2-type video recorders, is also input through the REMOTE connector. The 90 Hz triggering uses the Remote Sync Input, with the internal polarity jumper set to negative sync polarity, and the enabling jumper in the enabled position.

The output of the Sync Stripper (or remote sync) drives the Back Porch Generator, Vertical Sync Recognition, and Horizontal AFC. Outputs from the Vertical Sync Recognition and Horizontal AFC are used by the Field ID and Trigger Select to trigger the Sweep Generator. If Calibrator is selected, the Cal Drive signal from the Microcontroller provides the triggering signal.

The Horizontal AFC output, in conjunction with the Microcontroller, drives Line Select, which outputs a pulse that:

1. Drives the Z-Axis Control to unblank the CRT at selected line(s).

2. Provides a bright-up strobe at the selected line(s) for 2 Field Sweep.

- 3. Provides the Picture Monitor Output bright-up strobe.
- 4. Generates the Auxiliary Blanking strobe that is used by a companion 1720-Series for line select.

The ramp signal, output by the Sweep Generator, drives the Mag Amplifier, which provides three gain ranges, X1 (un-magnified Sweep), X10 (1 μ s/div. in 2 Line Sweep), and X25 (to display the full vertical interval in 2 Field Sweep, while providing 0.2 μ s/div. sweep rate in 1 Line Sweep). The Horizontal Positioning offset voltage is input to the Magnifier Amplifier to ensure sufficient range to position any part of the display onto the graticule.

	When the RGB Parade display is enabled, the sweep is shortened and offset by the RGB Staircase input signal, which produces three short ramps that are displayed (in sequence) as a normal length sweep.	
	The output of the Mag Amplifier and the X component of the Readout (from the Microcontroller) drive the Horizontal Output Amplifier, which matches impedances and normalizes gain (approximately 100 V for a 10 cm sweep length) in order to voltage drive the CRT horizontal deflection plates.	
CRT, Unblanking, and High Voltage	The blanking signal (from Line Select) and the Intensity and Readout voltages are used by the Z-Axis Control to generate an unblanking signal for the CRT during sweep time. When the sweep is magnified, the off-screen portion of the sweep is blanked to increase the on-off contrast ratio. The Focus Amplifier, which is controlled by the front-panel FOCUS control, provides a voltage to the CRT focus ring.	
	Trace Rotation provides compensation for the magnetic field surrounding the CRT. The CRT is of the Post Acceleration type, which requires a relatively high potential difference between the cathode and post anode. The boost in 2 nd anode voltage is provided by an encapsulated 4X Multiplier. Trace Rotation provides compensation for the magnetic field surrounding the CRT.	

Vertical Input Diagram 1

The video signal is input to the waveform monitor through amplifiers that can be clamped at back porch time. Once buffered by the input amplifiers, whose gain is -1, a Channel Switch selects the input to be filtered, drive the picture monitor output, serve as the internal sync source, and eventually be displayed on the CRT.

When an external reference (sync) source is used, the composite signal is input through an ac-coupled amplifier, which also has a gain of -1. Selection of the sync source is accomplished by a switch that is made up of a common base pair and switching diodes. A clamped sync stripper is used to remove active video information and regenerate a composite sync signal for use by time related monitor circuits.

An accurate 100 kHz waveform from the Microcontroller is amplified and its amplitude set and controlled by the Calibrator. Calibrator output is enabled and output through the vertical amplifier low pass filter. The calibrator enable is also generated by the Microprocessor.

Input Amplifiers The rear-panel Channel A and B inputs are high-impedance bridging loopthrough inputs compensated for use in 75 Ω systems. Each amplifier has its own DC Restorer that is controlled by the front-panel restorer switch. Restorers are either both on or off; the ONDCR pulse enables (disables) both U395C (pins 10 & 11) and U395D (pins 14 & 15). When U395C and D close they couple the back porch sample dc level, from the input amplifier output, to the amplifier inputs. See Timing (Diagram 3) for more information about the generation of the BACKPORCH signal.

> Because the Channel A and Channel B Input Amplifiers are identical, circuit numbers for the Channel A Amplifier are used to simplify the remainder of this discussion.

The Input Amplifiers are inverting feedback operational amplifiers with a gain of -1. The input resistor (R_i) is R196 and the feedback resistor (R_f) is R198. A plug and jumper is provided to select input coupling. J197 is factory set to the 1-2 position for ac coupling; it can however, be moved to the 2-3 position to provide dc coupling by bypassing C197, the ac-coupling capacitor.

The DC Restorer is a feedback sample-and-hold circuit. Sampling occurs when U395A (pins 2 & 3) close at back porch time. When the switch closes, the hold cap (C398) charges up to the dc level of the amplifier output. If ONDCR, from the Microprocessor (Diagram 5) is present U395D (pins 14 & 15) closes and the loop-compensated Buffer Amplifier (U495A) drives the Input Amplifier input summing junction through R197. The time constant of the restorer does not attenuate 50/60 Hz hum by more that 10%. The choice of fast or slow dc restorer time constant is accomplished loop compensating the 2nd DC Restorer shown on Diagram 2.

Channel Switch The Input Amplifier output signals drive the channel switch, U492, through pins 2 & 3. The signal selection is determined by the level of the CH-B signal at U492 (pin 10). When CH-B is low, CH-B is selected; when it's high, CH-A is selected. The Channel Switch output (pin 6) drives a current mirror with three current sources.

One current source, through Q793, drives the rear-panel Picture Monitor Output Amplifier (SIG 2). C694 is the response adjustment that compensates the amplifier to match the 75Ω system input impedance. Q792 is the current source for the internal sync signal and Q791 is the current source for the remainder of the vertical. With a 1 V input signal there will be 1.11 mA of signal current flowing through R392 (or R393) into the channel switch. This signal current is available to drive the vertical through Q791 and the PIX MON OUT through Q793.

Only 0.5 mA of signal current is available to drive the sync stripper through Q792. Its emitter resistor, R694, is twice the resistance of R792 and R693, the emitter resistance for Q790 and Q793.

External Sync Input and The external sync signal from the rear-panel EXT REF loop-through is buffered Source Switch by an operational amplifier consisting of U795A and B. It has a gain of -1, which is determined by the combination of input resistor (R_i) R997 and feedback resistor (R_f) R898. The operational amplifier output drives Q798, which is one current source for the Source Switch (U795D). The internal sync current source, for the other side of the common emitter Source Switch (U795D), is Q792. It provides signal current through pin 5 of U795D which also forward biases CR696 when the switching signal ($\overline{\text{EXT}}$) is high. CR698 keeps CR696 from conducting when external sync input is selected. When external sync is selected, $\overline{\text{EXT}}$ (from the Microprocessor Diagram 5) goes low, turning on U795 (pins 1, 2, & 3) so that signal current from Q798 (the external sync current source) forward biases CR697. The 0.5 mA of signal current from Q798 (external) or Q792 (internal) drives into a common base stage, Q799, which develops a 1 V video signal across R797. Sync Stripper The Sync Stripper removes the active video portions of the signal to generate the sync required for timing signals. The circuit detects the sync tip, stretches it (amplifies that portion of the signal), and generates a clean sync signal. The circuit responds well to pulses up to 1 MHz, then rolls off to eliminate any effect from subcarrier or high frequency noise at the sync level. The Sync Stripper circuit consist of a two-stage amplifier and a clamp (or dc restorer). Figure 4-2 shows a simplified schematic of the circuit. Both amplifier stages feed back sync level information to the clamp. The first stage of the amplifier inverts the video signal and clips it near the sync tip. (The bandwidth of the Sync Stripper keeps the circuit from clamping to high frequency components of the video signal.) This operational amplifier stage is made up of Q992 and U892C. The gain setting resistors R993 (R_i) and R992 (R_f) let the amplifier provide high gain to the sync tip portion of the signal, but clip any signal components slightly above the sync level. During sync time, the clamp circuit maintains the output of the first amplifier stage at about +5 V, which is fed back to the clamp circuit, through CR990, to maintain the proper level. During non-sync times (active video), CR988 and CR989 are both on to shunt U892C and greatly reduce the gain. Shunting the active video limits the saturation of U892C, which allows it to respond quickly to the next sync transition.

Figure 4-2: Simplified block diagram of the Sync Stripper.

An inverting amplifier, U892B, is the second amplifier stage. It provides negative-going sync and cleans up any remaining noise or active video on the signal. Output of the second stage is also fed to the clamp.

The clamp circuit is formed around U892E and U892A. U892E and CR990 form a current switch. When the first stage output level is at sync tip, current flows through U892E, which charges C887. At the same time U892B pulls down on CR887 to provide a discharge path for C887. The result of these opposing actions is to establish an equilibrium voltage on C887. At the end of sync time U892C saturates and pulls down on CR990 to shut off U892E.

Filter Selection The three filters are driven from current source Q791 through one of the analog switch sections of U786. Only one switch section will be closed at a time, as dictated by its enable, from the Microprocessor (Diagram 5) going low. Chrominance filters are clamped to ground when low pass filtering or flat is selected. In this condition Q777 and Q776 are turned on clamping the chrominance filter outputs to ground.

When the chrominance filter is turned on an additional bias current for the accoupled filters (3.58 and 4.43 MHz) is required. It is supplied by pulling the emitters of either CR671 or CR670 low with the Microprocessor-generated enable signal, which turns on Q775 to saturate Q774. When Q774 saturates its collector goes to +11.8 V. Signal current from the enabled filter drives the emitter of a common base amplifier input to the Gain Cell (Diagram 2). At a 0 Vdc level 2 mA of bias current is added to 1 mA of signal current that drives the input of the Gain Cell.

When dual filter or dual input display is selected a blanking signal is required to mask any potential switching transit that might occur. Whenever CH B or FLAT goes active an RC circuit consisting of C94 (CH B) or C871 (FLAT) and R878

and R885 generates a pulse through Q764. Q765 inverts the blanking pulse, which is input to the blanking circuitry on Diagram 4.

Calibrator The Calibrator is a common base amplifier, Q587, that is driven by a 100 kHz square wave from the Microprocessor (Diagram 5). It is switched at the 100 kHz rate. The gain is set by adjusting R689, the Cal Amp. The emitter current drives the Low Pass filter (which is at least 30 dB down at 3.58 to 4.43 MHz) through an analog switch, U585C, which is activated by the Microprocessor-generated CAL.

VERTICAL OUTPUT Diagram 2

The filtered video signal drives the signal input of a gain cell whose gain is controlled by the front-panel V CAL and, when selected, VAR VERTICAL GAIN. The gain normalized video signal drives an amplifier that can be clamped at back porch time with either a fast or slow time constant clamp, which is also selected by front-panel selection.

The Switchable Gain Amplifier input is the dc level shifted (Vertical Position) output of the Gain Cell Amplifier. Amplifier gain is switchable between X1 and X5 as selected by the front-panel X5 VERTICAL GAIN. Amplifier output drives a Bridge Limiter that prevents the Vertical Output Amplifier from being overdriven.

The Vertical Output Amplifier is driven by the processed video signal or, in Line Select, by an appropriate combination of video and the Y-Axis portion of the readout signal. The output amplifier has enough gain to drive the CRT deflection plates, while providing the compensation for the deflection plate capacitance.

The picture monitor out signal from the Channel Switch (Diagram 1) is amplified and compensated to drive a 75Ω load by the Pix Mon Out amplifier. In addition, a bright-up pulse is added to the picture monitor output signal.

Gain Cell Q684 drives the Gain Cell. It is a low impedance (to terminate the filters) common base amplifier. The signal voltage off collector is approximately 0.5 V.

The Gain Cell (U578) is driven differentially; pin 1 is the signal input with a -3.0 Vdc level plus the signal voltage. R675 determines the maximum gain of the Gain Cell. The amount of gain is controlled by varying the difference between the bases of the two transistor pairs controlling the signal current flowing out of pin 6 or pin 12. The front-panel V CAL control, R700, sets an input dc level on pin 10 of the Gain Cell. When Variable Gain is selected, the

front-panel GAIN control alters the dc level on pin 10 through an analog switch, U585B. The switch is closed only when Variable is selected.

The current flowing out of pin 6 drives the Gain Cell Amplifier, while the current flowing out of pin 12 drives into a collector load, R480.

Gain Cell Amplifier The Gain Cell Amplifier is a clamped inverting operational amplifier driving both the Switchable Gain Amplifier and the 2nd DC Restorer. It consists of Q673, Q674, and Q669, with Q669, an emitter follower, operating as the output stage. Amplifier gain is approximately 4.

2nd DC Restorer The DC Restorer clamps the output level of the Gain Cell Amplifier to the dc level occurring at back porch time. DC Restorer drive is coupled through R474 into an analog switch (U277B) that is activated by the BACKPORCH signal. U277B closes during back porch time to charge the hold cap, C484. The Error Amplifier (U488) drives a current summing point at the input of the Gain Cell Amplifier through U585D. For slow restorer, R484 is in the loop compensation. However; for fast dc restorer, R484 is shorted to ground through U277C to speed up the loop time constant. The enable signal for U277C is from the Microprocessor on Diagram 5 and is only present when Fast DC Restorer is selected.

Switchable Gain AmplifierThe Switchable Gain Amplifier consists of Q476, Q477, and Q478, with Q469
as the switching element. When the base of Q469 is pulled low through R472,
amplifier gain is -1. R_i is R475 and R_f is the sum of R367 and R368. When its
base is high, Q469 saturates and grounds the collector end of R470 to put an
attenuator in the feedback path and increase gain by a factor of five. The output,
at the collector of Q476, drives a bridge limiter circuit comprised of CR280 and
CR380. See Figure 4-3 for a simplified diagram of the limiter.

The purpose of the limiter is to prevent the Vertical Output Amplifier from being over driven. The bridge limiter circuit, encompassing CR280 and CR380, is quiescently balanced (equal current through all arms) with no V_{in} . When there is a signal voltage (V_{in}) applied to the bridge (CR1-CR2), the output signal voltage (CR3-CR4) is approximately equal to the input. When V_{in} moves away from the quiescent state, the current in the bridge arms becomes unbalanced.

Figure 4-3: Simplified illustration of the Bridge limiter circuit.

When the bridge unbalances the current through the diodes changes, with more current flowing into the load through either CR3 (positive excursion) or CR4 (negative excursion), which turns the diode on harder. At the same time current flowing through the complementary input diode CR1 (positive excursion) or CR2 (negative excursion) is reduced and the diode starts to turn it off. If the change in V_{in} is large enough, the output diode takes all of the current (which turns off the input diode) and disconnects the input from the output. The bridge load, R378, R377, and R374, is also a voltage divider that sets the input dc level for the Vertical Output Amplifier at approximately -2 V.

Vertical Output Amplifier The level shifted input signal drives the base of Q383 during active video signal time. The active video signal is disconnected while Line Select readout is displayed (U277D). Q383 is driven by the Y-Axis signal, through U277A, when the vertical component of the readout is displayed. The Y-Axis signal is enabled through the switch when ROEN goes low.

The combination of Q382 and Q383 forms a shunt-feedback amplifier. Q382 amplifies and inverts the collector current flowing in Q383 to provide most of the signal current through R485. Because the current across Q382 is nearly constant the input-signal voltage is applied directly across its emitter resistor, R485, with very little distor+tion. Negative feedback is employed to improve

linearity and reduce the thermal distortions introduced by Q383. In addition, negative feedback increases the input impedance. A series compensation network consisting of R384 and C384 provides improved bandwidth and stability.

The combination of Q385 and Q387 form a shunt-feedback amplifier, identical to Q383 and Q382. The signal current for this amplifier is input through R485. Signal current through Q387 is equal in value and opposite in phase to the current change in Q382. The Limit Center, R489, balances the bias current flowing in Q382 and Q387. R387 and C387 form another series compensation to improve bandwidth and stability. R486 and C389 provide high-frequency peaking to improve the flat response; R385 and C385 improve low-frequency transient response.

Q280 and Q289 are common-base stages that couple the complementary signal currents to the non-inductive CRT load resistors, R184 and R186. The resulting signal voltages drive the CRT vertical deflection plates. R183 and R187 shunt the load resistors to provide the proper load resistance for the high-bandwidth output signal. L180 and L190 are adjustable shunt-peaking coils to increase the vertical bandwidth and allow precise adjustment of flat response.

Pix Monitor The Picture Monitor Output Amplifier consists of U978 and Q877. The amplifier is driven from pin 2 of U978D by the SIG 2 input from Diagram 1. The output, that drives a 75Ω load, is the emitter of U978A (pin 7). R883 and R884, on the amplifier input, develop the signal voltage 0.554V (1 mA * 554Ω).

The overall gain for this non-inverting amplifier is set by feedback divider resistors R975 and R876. The signal amplitude at the emitter of U978A is 2 V (0.554 * (1+3570/1400)). Q973 adds an offset to the video, for LINE SELECT operation, that provides the bright-up (or strobe) pulse. The amount of the offset is set by the value of R870.

Timing Diagram 3

Composite sync from the Sync Separator (Diagram 1) is used to time the Horizontal and Vertical Sync Generators. Outputs from these generators are used to develop line and field rate signals that are used to display selected lines or fields of information. The Clamp Pulses used to time the vertical amplifier DC Restorers are generated by a Back Porch Generator driven by the Horizontal Sync Generator.

The input Staircase for the RGB/YRGB parade display is input to an operational amplifier through the rear-panel REMOTE connector. The compensatable (dc level and transient response) RGB Amplifier is enabled (RGB ENABLE) by a TTL low.

Figure 4-4: Simplified representation of the AFC phase-lock loop.

Horizontal Sync Generator The Comp Sync, from the Sync Separator on Diagram 1, drives the timing input to U735. U735 is a registered 16-input gate array that outputs line rate enables and \overline{SYNC} . The line rate \overline{SYNC} output drives U844B, a non-retriggerable one-shot that outputs a pulse wide enough to lock out the twice line rate pulses in the vertical interval. The line rate signal, output from pin 5 (Q), drives the Back Porch Generator (U844A), the Horizontal AFC phase-lock loop (U644), and the sweep trigger selector (U535).

U644 is a phase-locked loop. See Figure 4-4. In this application a second comparator, U947B, is used to drive the internal VCO. The circuit's input, through pin 14, is line rate sync. R536 and C545 form an adjustable delay network that ensures filter or input switching occurs during H Sync time.

U644 has a VCO as one of the onboard functions. Its timing components (C643, R742, and R743) keep the oscillator frequency near line sync rate. When there is line rate sync the output of the comparator will be approximately equal to the U947B + input dc level and no correction voltage will be input to the VCO.

If line rate sync is interrupted, the VCO runs at, or near, line rate until sync is restored. When line rate sync is restored it will be out of phase with the VCO and the internal comparator (U644) will have an output indicating that the loop is unlocked. With an unbalanced input, the second comparator outputs an error signal that will: 1. Attempt to charge the loop filter. 2. Drive the VCO voltage input. When the VCO output changes to a new frequency, the comparator output changes; however, the charge on the loop filter reduces the effect of this change on the comparator in order to slow the loop response. When the loop nears lock the amount of change is very small.

Having H Sync generated by this AFC circuit allows the 1730-Series to sync up on noisy syncs and remain synced up on signals with missing H rate sync pulses. U841D is used as an inverter to output the required HSYNC.

The DC Restorer back porch pulse is generated by a one-shot, U844A. When <u>SYNC</u> occurs, U844A is cleared. The next line rate pulse output from U844B will start the one-shot, whose pulse width is determined by C848 and R849. The output pulse from Q99, an emitter follower, is time coincident with the back porch of the input sync signal. The Q output of U844B sets the position of the pulse, and C848 and R849 determine the pulse width.

Vertical Sync Generator U947A is an integrator whose output is normally low. The broad pulse in the vertical interval will cause its output to ramp up. When the broad pulse ends, and the serrated pulses begin, the output starts ramping back down. This negative-going signal is coupled through C853 to comparator U753B, to output the vertical rate sync pulses (V SYNC).

RGB AmplifierUnder normal operation the base of Q856 is pulled down by CR955, which
causes Q855 to saturate and ground the amplifier output. When exerted the $\overline{\text{RGB}}$
 $\overline{\text{ENABLE}}$, from the REMOTE connector, is inverted to provide a discharge path
for the emitter of CR955, which enables the RGB Staircase Amplifier.

The staircase signal from the REMOTE connector drives an operational amplifier composed of Q856 and Q855, whose gain is approximately 0.5. The amplifier is compensated, for optimum step definition (transient response), by C953. R856, the RGB Offset adjustment, compensates for input dc level variation.

Field ID and Trigger Select U535 is a 16-input, registered gate array containing a D-type flip-flop. Line rate sync (from U644) drives its Data input, which is clocked through by vertical sync from U753B. Because of the half-line offset between fields, in the vertical sync, alternately a high or a low line rate sync level is clocked out to enable the flip-flop outputs. FIELD is a frame rate square wave that is high for one field and low for the other, that provides field rate timing information to the Micro-processor. The V TRIG output triggers the Field Rate Sweep Generator. There is no field identification for RGB and Remote Sync operating modes.

Non-standard sync inputs may cause the field identifying circuit to stop producing a field rate trigger signal for the Sweep Generator. When this happens, V SYNC is automatically used for triggering (without any field identification taking place). Q806 detects the absence of field identified vertical sync. The field rate square wave output as FIELD, keeps C906 charged, which holds pin 19 of U535 high when there is field identification.

Figure 4-5: Elements for line select timing: a) Line select off. b) 2-field line select.

A one-field trigger can be used, in normal configured instruments, by pulling the REMOTE <u>ILIN-1FLD</u> input low to turn on Q821. Turning on Q821 shuts off Q806 and allows C906 to discharge. The resulting low input on pin 19 of U535 switches the V SYNC pulse output to U535 pin 14 to trigger the Sweep Generator at the field rate.

V TRIG is the field rate trigger signal enabling the Sweep Generator, which is positive edge triggered. Field 1 or Field 2 sweep triggering is selected by the FLD1/FLD2 control line from the processor. A positive edge is output at the start of the selected field.

Figure 4-6: Relative line select elements for the 2-line display.

In addition, U535 decodes instructions for selecting either the applied sync (\overline{CAL} high) or the Calibrator (\overline{CAL} low) for the source of line rate sync (H TRIG).

Displaying the appropriate lines in the LINE SELECT mode is achieved by blanking the CRT beam the rest of the time. The LIN SEL signal from the Microprocessor is used by U735 to generate $\overline{\text{LINSTRB}}$, which is the blanking signal, and $\overline{\text{PIXSTRB}}$, which is the strobe signal for the rear-panel Picture Monitor Output. See Figure 4-5 for timing details.

Figure 4-6 and Figure 4-7 are timing diagrams that show the signal relationships for 2 Line and 1 Line sweep rates in the LINE SELECT mode.

Horizontal and vertical triggering signals enable integrator sweep generators, by dictating when retrace occurs. The output of the selected sweep generator drives a Magnifier Amplifier, which provides sweep magnification, RGB staircase input, and positioning control. The output of the Magnifier Amplifier drives the Output Amplifier to match gain and impedance for the CRT deflection plates. When 1 or 2-line Line Select is displayed readout is switched into the Output Amplifier, for CRT display, on a time sharing basis with the sweep information.

Figure 4-7: Relative line select timing elements for the 1-line display.

Sweep Generators and Horiz Output Diagram 4

Sweep Generator	U552B (Line Rate Sweep Generator) and U552A (Field Rate Sweep Generator) are integrators, one of which is disabled while the other is running. The selection is controlled by the H and V Trigger signals from the Sync Generators (Diagram 3) and the LIN/FLD control line from the Microcontroller. When a trigger arrives, for the selected sweep, the D-type flip-flop (U541A or B) Clear is high and Preset is low, to set Q high and turn on Q451 or Q450, which discharges the integrating capacitor (C448 or C453). See Figure 4-8. The Q output of U541A or B going high also starts a one-shot (U741A or B) which pulls the flip-flop Preset low which assures at least 2μ s (line-sweep one-shot time constant) of discharge (retrace) time. Field sweep one-shot time constant is 2 ms. At the end of the time constant Preset goes high and Clear goes low causing the flip-flop Q output to go low and turn off Q451 or Q450 to start charging the integrating capacitor.

Current source for the integrators is through R654. When a one line or field sweep (including RGB parade) is selected, pin 3 of U735A is pulled low and effectively shorts out R654 to provide more current for a faster sweep. Q750 provides a compensation for 50 Hz sweep by taking away a small amount of current when operating with 625/50 Hz sweep rates.

Figure 4-8: Timing signals for 1-line and 2-line sweep.

If there is no H or V Trigger, the output of the running Sweep Generator is self retriggered. When the ramp amplitude reaches about 3/4 of its maximum amplitude U445B trips and sets the flip-flop Preset high to turn on Q451 or Q450 to start retrace. Just before retrace begins U445A also trips and pulls the flip-flop Clear high to lock out the trigger signal.

The Microcontroller-generated 2H SWP PH retriggers the Line Rate Sweep Generator by turning on Q451 (which discharges the integrator capacitor, C453) to synchronize the sweep for Line Select or when dual filtering or input switching is selected.

The output of either one-shot, or LINSEL BLNK, is gated through U334B to become the blanking enable, which ensures that the CRT will be blanked during retrace and unblanked during the portion of active sweep that is to be displayed.

Magnifier Amplifier An operational amplifier consisting of U564C and D and Q566 positions and magnifies the sweep signal. R557 and R558 are the central elements of the feedback resistor network. The value of the network is altered by R552 (1 μ s Cal) and R553 (0.2 μ s Cal) when magnified sweep rates are selected. The junction of input resistance (R559) and the feedback resistance network (R557 and R558) is the amplifier input summing junction.

Horizontal positioning voltage is input to an operational amplifier, U655B, which drives the Magnifier Amplifier summing point (along with the RGB

	staircase signal, when RGB/YRGB operation is selected). The length of the sweep, in RGB mode, is set by jumper J456 to accommodate either three- or four-step sweeps (for RGB and YRGB modes).
	U465A and U465B are comparators used to sense when the output of the Magnifier and Position Amplifier have driven the CRT beam to the edge of the CRT screen. When the beam is horizontally overdriven, the input to U234C is pulled low to generate the BLANK enabling level for the Z-Axis Amplifier (Diagram 6).
Horizontal Output Amplifier	The Horizontal Output Amplifier is composed of Q858, Q860, Q862, and Q864, with Q868 and Q865 serving as current source. R960 provides the differential mode feedback; R958 and R959 provide the common mode feedback that biases the outputs to approximately 50 volts. The gain of the amplifier is determined by a voltage divider with two adjustments, R660 (Sweep Length Adj.), and magnified sweep registration R661 (Mag Registration Adj.). In LINE SELECT, Q762 and Q763 switch out the horizontal sweep and switch in the horizontal X-Axis component of the line select readout.
Microcontroller Diagram 5	
Ū	The Microcontroller is the brain of the 1730-Series Waveform Monitor. It monitors the front panel, Store/Recall functions, and the Remote interface. Changes to any switch setting or remote line is converted into appropriate control levels for circuits in the rest of the monitor.
Microprocessor	The 8052 Microprocessor (U522), used as the 1730-Series Microcontroller, contains 8K of masked ROM. The on-board masked ROM holds the Microprocessor machine instructions. Crystal-controlled oscillator frequency is 12 MHz.
	The processor operates with an eight-bit multiplexed address/data bus that interfaces through Port 0 (pins 32-39). Front-panel switches and Recall selections are sensed by Port 1 (pins 1-8). Each front-panel momentary contact switch (along with the Recall switches) has a specific row and column address. Functions are changed by simply pushing (to toggle) or pushing and holding a front-panel momentary contact switch. As an example: When row 1 and column 1 are connected together (by switch closure) the sweep rate toggles between the 2-line and 2-field sweep rate; however, if the switch is held in for a discernible interval the processor will switch sweep rate to 1 line.
	The I/O Port 2 provides eight additional interface lines. Three lines communi- cate with the NOVRAM (Clock-pin 21, Data-pin 22, and Chip Enable-pin 23). Four lines (pins 25-28) output high levels to drive analog switching functions

(X5, BLANK DOT, LINSEL, and 2H SWP PH). Pin 24 is the external communications enable that controls the Auxiliary interface.

Pins 13, 14, and 15 input horizontal (line) sync and vertical (field) sync, to decipher line select data and real-time switching functions (A/B and Low Pass/ Flat switching). The period for the FIELD, pin 12, determines the phase of the 60/50 control line. The status of this line is held permanently high (1730) or permanently low (1731) for single standard instruments by the positioning of J504. In the 1735 the jumper is not used and the Microprocessor determines the level output on this line. 60 Hz (NTSC) mode of operation is selected for field rates greater than 55 Hz, and 50 Hz (PAL) mode for field rates less than 55 Hz. If signal field rate is close to 55 Hz, the standard selection may be indeterminate and oscillate between 50 and 60 Hz. Automatic standard switching is delayed from the signal switching by several video frames, to ensure that false switching does not occur. If loss of reference occurs, the current standard is maintained until reference is restored. The level of the 60/50 output dictates selection of the Chroma filter and the line numbering for LINE SELECT.

Pins 10 and 11 are the Auxiliary bus (TXD pin 11 and RXD pin 10). U809B and C are buffers for this bus structure which connects directly to a 1720-Series through the rear-panel AUXILIARY connector.

Pin 17 (RD) is the remote input enable for U731, the REMOTE input buffer and U809A, the REMOTE STORE buffer. Pin 16 (WR) enables readout DAC (U325), clocks the I/O Data Latch (U532), and enables the internal registers in the LED Driver (U407).

The functions of the control lines, originating on the Microcontroller diagram, are shown in Table 4–1. The active condition of the line, and the expected result, when active, are detailed here.

Signal Line	State	Result
X5	High	Enables 5X Vertical Magnifier. (U522)
BLANK DOT	High	Blanks between dots in Line Select readout. (U522)
LINSEL	High	Unblanks the CRT for Line Selected line. (U522)
2H SWP PHASE	High	Resets 2H Sweep Generator for Line Select and real-time switching functions. (Q626)
RXD		Used in serial port diagnostics and Auxiliary. (U809B)
TXD		Sends data to companion 1720-Series. (U809A)
CAL DR		100 kHz pulse to Calibrator. (U331B)
CAL	Low	Enables Calibrator. (U532)
ROEN	High	Enables readout in Line Select. (U532)

Table 4–1: Control Line Functions

Signal Line	State	Result
LIN/FLD	High	1 or 2 Line display. (U532)
LIN/FLD	Low	2 Field display. (U532)
TWO/ONE	High	2 Field or 2 Line display. (U532)
TWO/ONE	Low	1 Line (no single field display possible). (U532)
MAG	High	Enables Horizontal Magnifier. (U532)
EXT	High	Enables internal sync reference. (U532)
EXT	Low	Enables external sync reference. (U532)
FLD 1/FLD 2	High	(NTSC) Field 1 trigger in 2 Field Sweep. (PAL and PAL-M) Field 2 trigger in 2 Field Sweep. (U532)
FLD 1/FLD 2	Low	(NTSC) Field 2 trigger in 2 Field Sweep. (PAL and PAL-M) Field 1 trigger in 2 Field Sweep. (U532)
LIN SEL EN	High	Blanks CRT for Line Select, except during LINSEL high. (U532)
X-AXIS		Analog signal to horizontal deflection amplifier for Line Select readout. (U231A)
Y-AXIS		Analog signal to vertical deflection amplifier for Line Select readout. (U231B)
CH B	High	Enables CH-A input. (U884)
CH B	Low	Enables CH-B input. (U884)
ON DCR	Low	Enables DC Restorer. (U884)
3.58	Low	Enables NTSC and PAL-M Chrominance filter. (U884)
4.43	Low	Enables PAL Chrominance filter. (U884)
LPASS	Low	Enables Low Pass filter. (U884)
FLAT	Low	Enables Flat (no filter). (U884)
VAR	Low	Enables vertical variable gain. (U884)
IF 1730 DCRF	Low	Enables fast DC Restorer if ON DCR is high. (U884)

 Table 4–1: (Cont.)Control Line Functions

- **NOVRAM** U725 is the Non-Volatile Random Access Memory (NOVRAM) used to retain the current front-panel status and the front-panel status for the Stored Recalls (Auxiliary). Data is written in and read out through pins 3 and 4; pin 22 of U522 controls the flow of data. The NOVRAM serial clock is output by U522 (pin 21), the Chip Enable is output from U522 pin 23. These three lines (Clock, Data In/Data Out, and Chip Enable) are active when:
 - **a.** Power is turned on.
 - **b.** Any front-panel switch is pressed.
 - c. A Store or Recall is requested.

U726 is the power down detection circuit. It detects the loss of instrument power in time for the NOVRAM (U725) to execute a save operation. When the +5 V supply drops a few hundred millivolts, pin 7 is pulled low, which pulls the STR for U725 down, causing it to Store its current status. The front-panel and Auxiliary (Store/Recall) data is saved in a matter of milliseconds when the power starts to drop below safe operating levels. U727 is a three-terminal regulator operating from the +15 V supply, which comes onto the circuit board from the main Power Supply. As soon as the +15 V raises enough to provide a +5 V output from U727, U725 recalls the data saved so that it will be available to the Microprocessor when all supplies are up to their operating tolerances.

- **Switch Control** U884 is a serial-in/parallel-out register that is loaded with the real-time switching data from the Microprocessor serial port (pin 10) whenever pin 24 of U522, goes high. When pin 24 is high, the serial input of U884 is enabled and the external communications input, through U809B, is disabled. The eight bits of serial data now in the internal register are clocked out, in parallel, by the leading edge of H (line) Sync, which is the clock signal driving U884 pin 12.
- Address Demux U527 is the Address DE-MUltipleXer (Demux) used to decode the lower eight bits of the address line. Even though both addresses and data share the same Microprocessor port, only addresses are present when U527 is clocked by the Microprocessor ALE output.
 - **Readout Drive** U325, through U231A and B, drives the X and Y axes of the dot-scanned line select CRT readout. U325 is a dual D/A Converter (DAC) whose internal registers are loaded from the Data/Address bus and clocked by the Microprocessor WR output.
 - **I/O Data Latch** U532 is the data latch outputting control signals to the 1730-Series non real-time switching and the readout enable (ROEN). The addresses are loaded from the Address Demux (U527) and clocked out by the Microprocessor WR output. The ROEN operates in conjunction with the Microprocessor Blank Dot output (pin 26) in order to display the data output from U325 on the CRT.
 - **Cal Drive** U331 divides down the Microprocessor ALE output to generate Cal Drive. U331 is enabled by the CAL from the I/O Data Latch, U532.
 - **LED Drive** The front-panel LEDs are driven in six common banks by U407. U305 provides a common current drain that is enabled by U407. Data registers in U407 are written into by the Microprocessor over the eight-bit address bus and read out to front-panel LEDs when WR goes low.

Control Circuit Diagram 6

	Blanking signals, for video and readout, are input to an intensity switching matrix along with a dc voltage level set by the front-panel INTENS control. Focus level, for the CRT focus anode, is set by regulating the current through a transistor current source. The amount of focus current through the transistor depends on the setting of the front-panel FOCUS control. The effects of small variations in the magnetic field surrounding the instrument are compensated for by an adjustable magnetic field placed around the CRT bulb. Scale Illumination for the CRT face plate is set by controlling the output amplitude of a triangle generator that drives the scale illumination bulbs.
Focus Control	The Focus control operation must also control two different display criteria. In the normal mode of operation, the Focus voltage will be selected by the control setting only (Q242 is off). When a Line Select Un-Blanking pulse occurs, U239B turns off and additional current flows through Q242. R245, the LS Focus adjustment, is adjusted for optimum focus in LINE SELECT at the normal display focus setting.
Z-Axis Control	U252 is a transistor array with two of the transistors connected as a differential current switch. The static output level (pin 8) is set by the front-panel INTENSi- ty control using Q243 (in the Focus Control) as a current source. The Blanking signal is input to the transistor switching array through U252B (pin 9). When it goes high, the current output, collector of U252A (pin 8), is shut off and the Z-Axis Amplifier (Diagram 9) blanks the CRT. See Figure 4-9.
	In LINE SELECT mode, the intensity setting has to change to brighten up the line or lines. This is accomplished by increasing the current through the current source (Q243). U239A is an open collector, dual comparator whose output goes low during Line Select Blanking to allow the full current available, across R238 and R241, to flow in the circuit.

Figure 4-9: Z-axis timing for readout: a) Two-field display intensifies the line (lines) to provide a bright-up strobe. b) In 1- or 2-line sweep, alpha numeric readout in the upper left corner of the CRT is used to convey the number of the first selected line.

- **Trace Rotation** Trace rotation compensates for changes in the magnetic field surrounding the 1730-Series. Q142 and Q143 are emitter followers to provide Trace Rotation current to the CRT surrounding coil located inside the CRT shield. Amplitude and polarity are controlled by the front-panel ROTATE screwdriver adjustment.
- **Graticule Illumination** U263A is a triangle generator whose output is compared to the front-panel SCALE control output level, by U263B (a comparator). Whenever the output of U263A is higher than the level from the front-panel SCALE control, Q158 is turned on and current is drawn through the bulbs (DS100, DS200, and DS300) to ground. The duty cycle of Q158 is determined by the level set by the front-panel SCALE control.

J100 is normally in the 1-2 (Lights Enabled) position. In the 2-3 position, the graticule scale illumination is disabled.

 \pm **11.8 V Regulators** The + and -15 V supplies generated by the main low voltage power supply are further regulated to meet the power requirements of the Main (A3) circuit board. U164 is the regulator; its reference level is set by R167, the -11.8 V Adjust. U172 is the +11.8 V supply regulator and its reference level is set by R168, the +11.8 V Adjust.

Front Panel Diagram 7

The front-panel indicators are driven from Microcontroller light driver register and LED drivers from Diagram 5. The front-panel switches are momentary closure (with some hold for additional function capabilities) that are monitored by the Microprocessor, which is also on the Microcontroller (Diagram 5). In addition a series of front-panel controls provide variable dc operating levels as a means of compensating for variable operating requirements and conditions.

Indicators and Switches The front-panel LED indicators are arranged in six columns returned to a current source by four returns, designated as rows, in order to provide the Microprocessor with a set of column/row matrix addresses. An LED indicator lights when there is a complete circuit from the Light Driver (Diagram 5) through the LED and back to the Light Driver.

Switches complete a simple matrix that is read by Port 1 of the Microprocessor. A completed circuit through the processor (switch closure) dictates an output through the Data I/O that changes one or more operating conditions. Some of the switches are read in two different ways by the Microprocessor. When touched and released they cause the Microprocessor to toggle to the next item on that switch's menu. When held in, the Microprocessor selects a specific operation. Hold for function switching options are outlined in blue on the front panel.

Controls A set of variable controls consisting of the Horizontal Position, Vertical Position, Vertical Calibration, Scale, and Focus controls select a dc voltage level between +11.8 V and -11.8 V.

The INTENSity control operates in conjunction with the Z-Axis Control circuit on Diagram 6. DC levels for Intens 1, Intens 2, and Intens 3 depend on the operating mode selected, which dictates the level on each of the leads.

Low Voltage Power Supply Diagram 8

The Low Voltage Power Supply converts the mains line voltage (90–250 VAC) to supply the power requirements of the instrument. The voltages supplied by the Low Voltage Power Supply are +40 V, \pm 15 V, and +5 V.

The Low Voltage Power Supply is called a Flyback Switcher. When switcher mosfet Q9 is turned on, its drain voltage drops to approximately 0 V. The current through the 350 μ H primary winding of T3 begins ramping up. The voltages present at all secondaries is such that the rectifier diodes are reverse biased. Energy is being stored in the magnetic field of T3. When Q9 turns off, the drain voltage "flies back" in a positive direction. Current now flows in all of the secondary windings and supplies power.

Line Rectifier and Filter The input line voltage is filtered by the rear-panel connector to reduce the electrical noise conducted into or out of the instrument. R89 limits the initial charging current through the rectifier diodes and C54.

CR21, CR22, CR23, and CR24 form a bridge rectifier. C54 filters the 110 to 350 VDC rectifier output. L4 filters the switching noise produced by the switcher. R102 reduces the circulating current in the parallel circuit consisting of L4 and C44. DS4, R93, and R94 form a line voltage indicator. R91 and R92 charge C42. C42 provides power to U5 until the primary housekeeping winding provides power through CR17.

Pulse Width Modulator

U5 is a current-mode Pulse Width Modulator (PWM). A current-mode PWM uses two feedback loops. The inner current-feedback loop directly controls the switcher mosfet peak current. The outer voltage-feedback loop programs the inner loop peak current trip point.

U5 pin 2 is the inverting input of an internal op-amp. The non-inverting input is set to 2.5 V by an internal voltage reference. Current from the peak detector flows through R83 and R79. R84 provides a $100 \,\mu$ A offset. The voltage at U5 pin 1 will vary in order to maintain U5 pin 2 at 2.5 V.

The voltage at U5 pin 1 is modified by an internal circuit and sets the trip point of the internal comparator. U5 pin 3 is the external input to the comparator. R88 and C52, connected to U5 pin 4, set the internal oscillator to 80 kHz.

The circuit works as follows: The oscillator resets the latch and U5 pin 6 goes high, turning the switcher mosfet on. The current through the switcher mosfet increases, causing the voltage across R96 to increase. This voltage is divided by R87 and R101, and is applied to the comparator (pin 3). When the voltage at U5 pin 3 reaches the comparator trip point, the latch toggles and the switcher mosfet is turned off. This process is repeated at an 80 kHz rate.

C58 increases the PWM noise immunity by rolling off the internal op-amp frequency response. R82 holds the switcher mosfet off as the circuit is powering up. R81 slows the turn-on of the switcher mosfet while CR27 speeds up the turn off.

Output Filters	The three output windings supply four output voltages. Each output is rectified by a single diode and filtered by an LC pi filter.
Error Amplifier (671–2890–07 and above)	The Error Amplifier regulates the +5 V output by feeding an error signal to the Pulse Width Modulator. VR1 is a 2.5 V shunt regulator containing an op-amp and a voltage reference. The +5 V is divided by R69 and R70 to provide 2.5 V to VR1, with fine adjustment provided by R99. C40 and R71 determine the gain and frequency response of VR1. VR4 controls overshoot of the +5 V at power up. R98 and CR26 provide a minimum operating current for VR1. R68 decouples C39 from VR1. Overvoltage protection for the +5V supply is provided by a crowbar circuit formed by Q11, VR3, R13, and R14.
Feedback Transformer Driver and Peak Detector	The 80 kHz sawtooth waveform at U3 pin 3 trips comparator U3. U3 pin 1 then feeds a trigger pulse to one-shot U4. U4 pin 13 outputs a 300 ns pulse to the 130 mA current source consisting of Q7 and Q8. When Q8 turns on, T2 pin 2 is pulled down until CR15 (Error Amplifier) is forward biased. The negative–go-ing pulse at T2 pin 2 is peak detected by CR16 and C46. The dc voltage present at the anode of CR16 feeds the Pulse Width Modulator and the Output Under-Voltage Shutdown circuit. CR29 resets T2 between pulses.
Output Under-Voltage Shutdown	If the +5 V is below 4.9 V, the Error Amplifier will cause the Peak Detector output to go below 2.9 V. The output of comparator U3B will pull low and shut down Pulse Width Modulator U5. C47 and R96 delay the operation of U3B long enough for the power supply to power up. If the +5 V does not reach 4.9 V within 50 ms of power up, U3B will shut down the switcher. The power supply will then cycle on and off every couple of seconds.

High Voltage Power Supply Diagram 9

The High Voltage Power Supply generates the heater, cathode, control grid, focus anode, and post accelerating potentials required to display the outputs of the Vertical and Horizontal Output Amplifiers.

HV Osc and Error Amp The High Voltage Power Supply is generated by a sine-wave oscillator and step-up transformer. Q6 and T1 are the principal elements of an Armstrong oscillator running at about 22 kHz. Error Amplifier U2 regulates the +100 V output and keeps the High Voltage Power Supply constant under varying load conditions by controlling the base current to Q6. The +100 V output is regulated directly, while the High Voltage Power Supply is indirectly regulated through a current feedback circuit.

R48, C16, R60, and R64 form the High Voltage Power Supply current feedback circuit. As the current from the High Voltage Power Supply is increased, the voltage to the + side of the Error Amplifier (U2) increases, which increases the base drive to Q6, the HV Osc. This current feedback compromises the regulation of the +100 V supply to keep the high voltage constant with varying intensities.

C66 and Q10 are a start delay circuit that holds the Error Amplifier output low, through CR30, until C66 is charged. Delaying the start of the high voltage oscillator allows the Low Voltage Power Supply to start, unencumbered by the load from the high voltage oscillator.

Power Supply Outputs CR4 is the high voltage rectifier. Filter capacitors C3, C4, and C8 work with CR4 to provide –2530 V to the CRT cathode. U1 is a four-times multiplier providing +11 kV to the CRT anode.

- **Focus Amplifier** Q1 and Q2 form an operational amplifier that sets the voltage at the bottom of the focus divider. The front-panel FOCUS pot determines the voltage at the bottom of the focus divider. The Center Focus control, R11, is set for optimum beam focus, as viewed on the CRT, with the front-panel FOCUS control set to mid range. Once the Center Focus adjustment has been set, adjusting the front-panel FOCUS control changes the voltage at the bottom end of the divider and, consequently, the voltage on the CRT focus anode.
- **Grid Drive Circuit** The cathode of the CRT is at a –2750 V potential with the grid coupled to the Z-Axis Amplifier by the grid drive circuit. The grid is approximately 75 V negative with respect to the cathode. The 200 V p-p sine wave present at the cathode of CR8 is input to the Grid Drive circuit where it is clipped for use as CRT control grid bias.

The sine wave from the cathode of CR8 is coupled through R47 to a clipping circuit consisting of CR5 and CR6. Clipping level for the positive excursion of the sine wave is set by the CRT Bias adjustment, R58. The negative clipping level is set by the front-panel INTENSITY control through the Z-Axis Amplifier. The clipped sine wave is coupled through C11 to a rectifier made up of CR1 and CR3. The rectified, clipped sine wave is the CRT control grid bias voltage. C9 couples the blanking signal from the Z-Axis Amplifier to the CRT control grid. DS1 and DS2 limit the CRT grid to cathode voltage at instrument turn on or off. DS3 limits the CRT heater to cathode voltage.

Z-Axis Amplifier

This is an inverting amplifier with negative feedback. R22 is the feedback resistor while R7, R20, and R33 act to maintain the summing junction at +5 V. Without any Z-Axis input current, the amplifier output is approximately +10 V. Negative Z-Axis input current will cause the output to go positive.

Q5 is a current amplifier feeding the output stage. Q3 and Q4 form a push-pull output stage. Q3 acts as a 2.7 mA constant current pull-up, while Q4 is the pull-down transistor. C6 speeds up the amplifier by coupling ac signals to the base of Q3. CR2 and R41 protect the amplifier during CRT arcing.

Figure 4-10: Pinout of the CRT Socket

Checks and Adjustments

Section 5 Checks and Adjustments

This section consists of two separate procedures. The first, a Performance Check, is used to determine compliance with the Performance Requirements in the Specification. The second is the Adjustment Procedure that provides the instructions on how to adjust the instrument and return it to operation within the specification.

In both procedures, front- and rear-panel controls and connectors on the instrument under test are fully capitalized (e.g., 2LINE SWEEP). Control and connector names on test equipment and internal controls and adjustments for the instrument under test are initial capitalized (e.g., Time/Div, Geometry, etc.).

Limits, tolerances, and waveforms given in this section are guides to adjustments and checks, and are not instrument specifications, except when listed in the Performance Requirement column of the Specification section of this manual.

Recommended Equipment List

The following equipment and accessory items are required to do the Performance Check and/or Adjustment Procedures. Broad specifications are followed by an example of equipment that meets these specifications; in most cases, the recommended instrument was used in preparing the procedures that follow.

Electrical Instruments

1. Test Oscilloscope

Vertical Amplifier:

30 MHz Bandwidth, 1 mV Sensitivity.

Time Base:

10 ns/div to 5 ms/div sweep speeds, triggering to 5 MHz.

For example: a TEKTRONIX TAS 465 Oscilloscope. Also 10X probes, P6106 (Tektronix Part No. 010–6106–03), and a 1X probe, P6101 (Tektronix Part No. 010–6101–03).

2. Television Signal Generator

Color test signals for the television standard of the monitor to be tested: color bar signal, linearity staircase with variable APL, pulse and bar (with 2T

pulse, 2T bar, and modulated pulse signals, and field square wave signal), multiburst signal, and black burst signal.

For example: NTSC TEKTRONIX 1410 with Option AA and Option AB (modified SPG2 and TSG7), TSG3, TSG5, and TSG6.

PAL TEKTRONIX 1411 with Option AA and Option AB (modified SPG12 and TSG11), TSG13, TSG15, and TSG16.

PAL–M TEKTRONIX 1412 with Option AA and Option AB (modified SPG22 and TSG21), TSG23, TSG25, and TSG26.

NOTE. The 1410–Series generators with standard SPG and TSG modules can be used, but not all checks and adjustments can be made. A standard SPG2, SPG12, or SPG22 module will not check lock to changes in sync amplitude, cw lock to changes in burst amplitude, and frequency lock to burst offset frequency changes.

The 1410, 1411, and 1412 Option AB are mainframes with modified TSG7 and TSG11 Color Bar generators that provide more accurately controlled output amplitudes.

The signal generators can be ordered with one or both options (AA and AB).

The TSG3, 13, and 23 are Modulated Staircase generators with variable APL.

The TSG5, 15, and 25 are Pulse and Bar generators with modulated pulse and field square wave signals.

The TSG6, 16, and 26 are Multiburst generators.

3. Sine wave generator, at least 250 kHz to 10 MHz.

For example: A TEKTRONIX SG503 Leveled Sine Wave Generator installed in a TEKTRONIX TM500 Series Power Module.

4. Function Generator

Sine Wave frequencies: 90 Hz to 2 kHz. Amplitude: 0.1 V to 10 V p-p when loaded by 75Ω .

For example: TEKTRONIX FG501A Function Generator installed in a TEKTRONIX TM500 Series Power Module.

5. Voltmeter

Range, 0 to greater than 100 Vdc; accuracy, $\pm 0.1\%$.

For example: TEKTRONIX DM504A in a TM500 Series Power Module.

6. Frequency Counter

Range, 100 kHz to 5 MHz; accuracy, $\pm 0.001\%$.

For example: TEKTRONIX DC503A in a TM500 Series Power Module.

7. Video Amplitude Calibrator

Signal, adjustable square wave 0.0 to 999.9 mV p-p with a resolution of 0.1 mV and an accuracy of 0.05%; frequency approximately 270 Hz.

For example: TEKTRONIX 067–0916–00 in a TM500 Series Power Module.

8. Power Module

for powering and housing TEKTRONIX DM501A, DC503A, FG503, 067–0916–00, and 015–0408–00.

For example: A TEKTRONIX TM506 Power Module.

9. Variable Autotransformer

For example: General Radio Metered Auto Transformer W10MT3W. If 220 volt operation must be checked, a conversion transformer or appropriate 220 volt autotransformer is needed.

10. Spectrum Analyzer with Tracking Generator

Bandwidth \geq 10 MHz and sensitivity to 50 dB.

For example:

TEKTRONIX 2712 Opt 04

Auxiliary Equipment

11. Peak to Peak Detector Amplifier and Detector Head

Facilitates differential frequency–response measurements. Provides a high–impedance load and bias for the Peak To Peak Detector Head.

For example: TEKTRONIX 015–0408–00 Peak To Peak Detector Amplifier, includes one 015–0413–00 Peak To Peak Detector Head.

12. Step Attenuator

 75Ω constant impedance attenuator variable from 0 to 40 dB in 1 dB steps.

For example: A Wavetek 75803 Step Attenuator.

13. RF Bridge

Range, at least 46 dB return loss sensitivity, 50 kHz to 6 MHz.

For example: Wide Band Engineering Part No. A57TSCR. Also, a 75Ω precision Termination for use with RF Bridge, Wide Band Engineering Part No. A56T75B.

14. 75 Ω Terminators

Three required, one should be a feed-through type.

For example: End-line, 75Ω terminator (Tektronix Part No. 011–0102–00) and a feed-through 75Ω terminator (Tektronix Part No. 011–0103–02).

15. 75Ω Coaxial Cable

Three required.

For example: 42-inch RG59U (Tektronix Part No. 012-0159-00).

16. 10X, 75Ω Attenuator

For example: Tektronix Part No. 011–0061–00.

17. Alligator Clip to BNC Adapter

For example: Tektronix Part No. 013–0076–00.

18. Dual Input Coupler

Matched bnc cable-T for making phase comparisons between two inputs. Matched length of the two arms within ± 0.1 inch.

For example: Tektronix Part No. 067–0525–02.

19. Precision 50Ω Coaxial Cable

For example: Tektronix Part No. 012–0482–00 (used with the SG503).

20. 50 Ω -to-75 Ω Minimum Loss Attenuator

For example: Tektronix Part No. 011–0057–00.

21. Parade Display Test Connector

A 15-pin sub-miniature D-type connector (for example: Tektronix Part No. 131–0459–00), modified to enable and test the RGB Parade input. See Fig. 5-1.

Figure 5-1: Remote connector for RGB.

22. 90/100 Hz Test Connector

A 15-pin sub-miniature D-type connector (for example: Tektronix Part No. 131–0459–00), modified to enable and test the 90/100 Hz triggering. See Fig. 5-2.

Figure 5-2: Remote connector for 90/100 triggering.

Performance Check

The Short-Form Procedure is intended for those who are familiar with the complete Performance Check procedure. Step numbers and sub-step designations correlate directly to the steps in the Performance Check Procedure; this makes it possible to use the Short-Form Procedure as a table of contents.

Short-form Procedure

1. Preliminary Setup

- b. Connect autotransformer.
- c. Connect composite color bar signal.

2. Power Supply Operation

c. Check for stable operation over the prescribed voltage range.

3. Calibrator Frequency

- c. Check Calibrator frequency.
- d. Check that Calibrator is synchronized in 1LINE and 2LINE SWEEP.
- e. Check that Calibrator free runs in 2FLD SWEEP.

4. Sync Separation

a. Check instrument synchronization.

5. Sweep Operation

- b. Check sweep modes.
- d. Check for 1LINE and 2LINE SWEEP rates.
- e. Check for 2FLD SWEEP.
- g. Check that some portion of field blanking is displayed. (2H Mag.)

i. Check that some portion of horizontal blanking is displayed. (2 Line Mag.)

j. Check that each field in 2LINE MAG SWEEP can be positioned onto the screen.

6. Sweep Calibration

d. Check 2LINE SWEEP accuracy.

- e. Check 2LINE SWEEP linearity.
- h. Check 1LINE SWEEP accuracy and linearity.
- j. Check 1 μ s SWEEP accuracy and linearity.
- q. Check $0.2 \,\mu s$ SWEEP accuracy and linearity.

7. RGB/YRGB Parade Display

- d. Check shortened sweep length.
- e. Check sweep rate and magnification.
- f. Check range of HORIZONTAL Position control.
- h. Check added deflection.

8. 90/100 Hz Triggering

j. Check for stable display while varying generator frequency.

9. Vertical Gain and X5 Gain Registration

- f. Check 5X gain accuracy.
- h. Check VARIABLE GAIN control range upper.
- i. Check VARIABLE GAIN control range lower.
- n. Check X5 Gain registration.
- r. Check CH–B amplifier gain.

10. Calibrator Amplitude

b. Check Calibrator amplitude.

11. PIX MON OUT Operation

- e. Check PIX MON OUT level.
- h. Check dc level shift for intensified line.
- j. Check PIX MON OUT amplitude.

12. DC Restorer Operation

- b,c. Check that DC Restorer operates.
- i. Check SLOW DC RESTORER.
- k. Check FAST DC RESTORER.
- p. Check DC RESTORER with APL change.

s. Check DC RESTORER with loss of burst.

13. Flat Response

- d. Check CH–B flat response.
- g. Check CH–B X5 flat response.
- j. Check CH–A X5 flat response.
- l. Check CH–A flat response.

14. PIX MON OUT Frequency Response

d. Check Frequency Response.

15. Transient Response

- c. Check preshoot, overshoot, and ringing.
- d. Check pulse-to-bar ratio.
- e. Check bar tilt.
- g. Check field tilt.
- k. Check chrominance-to-luminance gain and delay error.

16. X5 Transient Response

- d. Check preshoot, overshoot, and ringing.
- e. Check pulse-to-bar ratio.

17. Low Pass Filter Response

e. Check amplitude difference from Flat to Filter.

18. Chroma Filter Response

- d. Check CHROMA Filter gain.
- g. Check CHROMA Filter cutoff.

19. Return Loss

- e. Check Input loop-through return loss.
- h. Check PIX MON OUT return loss.

Performance Check Procedure

1. Preliminary Setup

a. Set up the 1730–Series front-panel controls as shown in Table 5–1.

POWER	ON
INTENSITY	Set to preference
FOCUS	
SCALE	
/ERTICAL Position	Set later
HORIZONTAL Position	Set later
FILTER	FLAT
REF	INT
NPUT	В
GAIN (switch)	off
DC REST	OFF
/IAG	off
SWEEP	2LINE
FIELD	FLD1
LINE SELECT	off

- **b.** Connect the 1730–Series ac power cord to the variable autotransformer. Turn power on and set the autotransformer for either 110 or 220 Volts.
- c. Connect a composite color bar signal with 100% peak white bar and 75% amplitude color bars to the CH-B INPUT and terminate the opposite side of the loop–through with a 75Ω termination.

2. Check Power Supply Operation

REQUIREMENT – Check ac input range, 90–132 V or 180–250 V.

- a. Turn on the 1730–Series and adjust the controls for a usable display.
- **b.** Vary the autotransformer from 90–132 V or 180–250 V.
- **c. CHECK** for stable operation over the voltage range.

d. Return the autotransformer to 110 or 220 Volts.

3. Check Calibrator Frequency

REQUIREMENT – Frequency 100 kHz ±100 Hz, Synchronizes 1LINE and 2LINE SWEEP (free runs in 2FLD).

- **a.** Connect a X10 probe from the frequency counter to the blue CRT lead on the 1730–Series Main circuit board.
- **b.** Display the CAL signal at the 2LINE SWEEP rate.
- c. CHECK that the frequency of the Calibrator is 99.9 to 100.1 kHz.
- **d. CHECK** that the Calibrator is synchronized in both 1LINE and 2LINE SWEEP.
- e. CHECK that sweep free runs in 2FLD.

4. Sync Separation

REQUIREMENT – Check for stable sweep synchronization; internally 40 IRE $(300 \text{ mV}) \pm 6 \text{ dB}$, and externally 143 mV to 4 V.

a. CHECK – that the 1730–Series instrument can be synchronized to the amplitudes shown in Table 5–2, using the 1410–Series Option AA test signal generator. Check both 2LINE and 2FLD SWEEP for stable triggering.

REFERENCE SOURCE	SIGNAL	AMPLITUDE OF SYNC
Internal	Composite Video	143 mV to 572 mV (NTSC and PAL-M) 150 mV to 600 mV (PAL)
EXT REF	Composite Sync or Video	143 mV to 4 V (NTSC and PAL-M) 150 mV to 4 V (PAL)

Table 5–2. Amplitude

NOTE. Use the 1410–Series Option AA Variable Sync Amplitude control to change composite video sync amplitude. If the 1410–Series Option AA is not available, use the step attenuator with a non–terminated input. The step attenuator, set to 0 dB and 12 dB attenuation, yields 0.5 and 2X sync amplitude.

5. Sweep Operation

REQUIREMENT – Check that the correct sweep rate can be selected. Check that some part of the blanking interval is displayed when magnifying the centered 2LINE and 2FLD sweeps.

- a. Display INPUT A with nothing connected.
- **b. CHECK** that a sweep occurs at each SWEEP rate (2LINE, 2FLD, and 1LINE).
- c. Select CH–B INPUT.
- **d. CHECK** that the 1LINE and 2LINE SWEEP modes display one line and two lines of the color bar, respectively.
- e. CHECK for a 2FLD SWEEP display of the color bar signal.
- f. Select and center the 2FLD SWEEP, then push the MAG button.
- **g. CHECK** that some portion of the vertical (field) blanking interval is displayed.
- h. Select and center the 2LINE SWEEP, then push the MAG button.
- i. **CHECK** that some portion of the horizontal (line) blanking interval is displayed.
- **j. CHECK** that both lines of the 2LINE MAG SWEEP can be positioned onto the display with the HORIZONTAL Position control.

6. Check Sweep Calibration

REQUIREMENT – Timing accuracy: For 10 μ s/div. (2 LINE), 5 μ s/div. (1 LINE), and 1 μ s/div. (2 LINE+MAG): ±2%. For 0.2 μ s/div. (1 LINE+MAG): ±3%. Linearity: ±1%.

- **a.** Hold the 1730–Series REF button in until the calibrator signal is displayed.
- **b.** Turn off the HORIZONTAL MAG and select 2 LINE.
- c. Use the HORIZONTAL Position control to place the first falling calibrator transition on the $10 \,\mu s$ graticule mark (the timing mark on the left side of the graticule that goes completely through the blanking line). See Fig. 5-3.

Figure 5-3: Ten full cycles of calibrator signal between timing marks.

- **d. CHECK** for 10 full cycles of calibrator signal in the 10 center major graticule divisions, $\pm 2\%$ (1 minor division). Adjust the front–panel H CAL to place the 11th falling transition *exactly* on the 110 μ s graticule mark (the timing mark on the right side of the graticule).
- e. **CHECK** that no falling transition between the $10 \,\mu$ s and the $110 \,\mu$ s graticule marks is more than 1% (0.5 minor division) from a major graticule mark.
- f. Select 1 LINE SWEEP (push and hold).
- **g.** Use the HORIZONTAL Position control to place the first calibrator transition on the 5 μ s graticule mark (left side graticule timing mark).
- **h.** CHECK for five full cycles of calibrator signal in the center 10 major graticule divisions, $\pm 2\%$ (1 minor division).
- i. Select 2 LINE SWEEP and turn on the HORIZONTAL MAG.
- **j.** CHECK for 1 full cycle of calibrator signal in the center 10 divisions of the graticule, $\pm 2\%$ (1 minor division).
- **k.** Connect the multiburst output from the television signal generator to the 1730–Series CH–A INPUT. Connect the other side of the loop–through to the digital counter input.
- **I.** Set the multiburst generator to Low, Continuous, and Manual. Turn Markers off.

- **m.** Adjust the multiburst Frequency for a 5 MHz sine wave as measured on the digital counter.
- **n.** Select the 1730–Series INT REF and 1 LINE SWEEP. Turn on the MAG and VAR GAIN. Adjust the VAR GAIN control for approximately six vertical divisions of display.
- o. Set the multiburst generator to Composite.
- **p.** Use the 1730–Series HORIZONTAL Position control to display all but the first and last 10% of the sweep.
- **q. CHECK** for 10 cycles over 10 graticule divisions, ±1.5 minor divisions.
- **r.** Switch the multiburst generator to Continuous and check that its frequency, as measured on the digital counter, remains set at 5 MHz. Return to Composite.
- **s.** Repeat parts q and r of this step several times to ensure an accurate check.

7. RGB/YRGB Parade Display

REQUIREMENT – Attenuated sweep: 3.4 to 4.1 div. for 3–step or 2.5 to 3.1 div for 4–step. Staircase input gain: 10 V = 9 horizontal divisions ± 1.4 div. Attenuated sweep responds to sweep rate and magnification controls.

- **a.** Connect the color bar signal to the CH–A INPUT. Terminate the open side of the loop–through with a 75Ω end–line terminator.
- **b.** Display the color bar in 1LINE. Center the display. Note the position of the plug on J456 on Assembly A3 that selects the 3– or 4–step Parade display. The 2–3 position selects attenuation for a 3–step display.
- **c.** Connect the Parade Display Test Connector to the REMOTE connector. See Fig. 5-1.
- **d. CHECK** that the sweep has shortened to 3.4 to 4.1 divisions if P456 is set to a 3–step display, or 2.5 to 3.1 divisions if the plug on J456 (1–2) is set for a 4–step display.
- e. CHECK that the shortened sweep is 1LINE or 2FLD, according to the SWEEP controls, and that the sweep can be magnified.
- **f. CHECK** that the display can be moved to the sides of the screen with the HORIZONTAL Position control. It may be necessary to adjust R856.
- **g.** Position the display to the right side of the screen; it may be necessary to adjust R856, RGB Offset, to increase range of positioning. Fig. 5-7

shows the location of R856. Connect a 0 to +10 V, 2 kHz square wave to the bnc connector of the Parade Display Test Connector, as shown in the equipment list.

h. CHECK – that 7.6 to 10.4 divisions of deflection have been added by the square wave.

8. Check 90/100 Hz Triggering

REQUIREMENT – 90 Hz, ±15% (100 Hz, ±15%).

- **a.** Connect the function generator output through a dual input coupler and an in–line 75Ω terminator to the 1730–Series CH–A INPUT.
- **b.** Set the function generator for a 90 Hz (100 Hz PAL) 2 V p–p square wave.
- **c.** Install the bnc to alligator clip adapter on the remaining side of the dual input coupler.
- **d.** Install the 90/100 Hz sub-miniature D-connector on the 1730–Series REMOTE connector. See Fig. 5-2.
- e. Connect the alligator clip from the center connector (red) to pin 10 of the sub-miniature D-connector adapter.
- **f.** Move the jumper for J540 (90/100 Hz Enable) to the 1–2 position. See Fig. 5-7.
- g. Move the jumper for J635 to the negative position (2–3). See Fig. 5-7.
- h. Select 2FLD SWEEP.
- i. Set the 1730–Series VAR GAIN for a 1 V p–p square wave, 90 Hz output (100 Hz PAL).
- **j. CHECK** that the display remains stable (although sweep length varies) while varying the generator from 76 to 104 Hz (85–115 Hz PAL).
- **k.** If 90/100 Hz triggering is not going to be used, move the jumpers on J540 to the 2–3 position and J635 to the 1–2 position.
- **I.** Remove the adapter from the 1730–Series rear–panel REMOTE connector.

9. Check Vertical Gain and X5 Gain Registration

REQUIREMENT – Gains within 1% for both CH–A and CH–B INPUT. X5 gain within 5%. Input signals between 0.8 and 2 V can be adjusted to full–scale

video amplitude with the VARIABLE gain. Less than 1 major division shift from baseline between unmagnified and magnified signal.

a. Connect the Video Amplitude Calibrator (VAC) to the CH–A INPUT. Connect the linearity output of the television test signal generator to the CH–B INPUT. Do not terminate either loop–through. See Fig. 5-4.

Figure 5-4: Equipment hook-up for checking vertical gain.

- **b.** Set the VAC to 999.9 mV.
- c. Select CH–A.
- **d.** Adjust VCAL for exactly 140 IRE (1.00 V).
- e. Set the VAC to 0.200 V and change the 1730–Series gain to X5.
- f. CHECK that the display is 133 to 147 IRE (0.950 V to 1.05 V).
- g. Select CH–B INPUT.

- **h. CHECK** Turn on the 1730–Series VARIABLE gain (X5 is off) and adjust the VARIABLE control for a sync pulse amplitude greater than 100 IRE (720 mV for PAL).
- i. CHECK Adjust the 1730–Series VARIABLE control for a display amplitude of 140 IRE (1.0 V for PAL) or less.
- j. Turn off 1730–Series VAR GAIN.
- **k.** Terminate the CH–B loop–through with a 75Ω termination.
- **I.** Use the VERTICAL Position control to place the signal blanking level on the baseline.
- m. Select X5 GAIN.
- **n. CHECK** for less than 1 major division of baseline shift when switching between X1 (Gain off) and X5 GAIN.
- o. Turn off X5 GAIN.
- **p.** Connect the VAC to the CH–B INPUT. Do not terminate the loop–through.
- **q.** Set the VAC for a 999.9 mV square wave.
- **r. CHECK** that the vertical amplitude of the display of the 1730–Series is 138.6 to 141.4 IRE (0.990 V to 1.010 V).
- s. Disconnect the VAC from the 1730–Series.

10. Check Calibrator Amplitude

REQUIREMENT – Amplitude 1 V $\pm 1\%$.

- **a.** Push the REF and hold it in until the calibrator signal is displayed.
- **b. CHECK** the 1730–Series for a displayed amplitude of 138.6 to 141.4 IRE PAL (0.990 V to 1.010 V).

11. Check PIX MON OUT Operation

REQUIREMENT – Gain from Input 1:1 \pm 5% at 15 kHz. Dc level within \pm 0.5 V of 0 V. Selected line dc offset by approximately 180 mV.

- **a.** Install a 75 Ω terminator on the CH–A INPUT.
- b. Select CH–A and 2LINE SWEEP.
- **c.** Connect a coaxial cable from the PIX MON OUT to the test oscilloscope. Use an in–line terminator at the test oscilloscope. Connect the

Composite Sync from the television test signal generator to the 1730–Series EXT REF and terminate remaining side of the loop–through input. See Fig. 5-5.

Figure 5-5: Checking PIX MON OUT signal amplitude.

- d. Set the 1730–Series REF switch to EXT.
- e. CHECK that the level at the PIX MON OUT is $0 V \pm 0.5 V$.
- **f.** Turn on the 1730–Series LINE SELECT and set the test oscilloscope sweep rate to display at least one field.
- **g.** Using the test oscilloscope Magnifier and horizontal position control, display the dc level (intensified) shifted line.
- **h. CHECK** that the dc level shift for the intensified line is approximately 180 mV.
- i. Connect the color bar signal to the CH–A INPUT.

- **j. CHECK** that the amplitude of the color bar is within 0.95 to 1.05 V from sync tip to the 100% peak white bar, as displayed on the test oscilloscope. Turn OFF the 1730–Series LINE SELECT.
- k. Disconnect all signal cables from the 1730–Series Waveform Monitor.

12. Check DC Restorer Operation

REQUIREMENT – Attenuation of 60 Hz input signal 20% or less. Blanking level shift with APL change, less than 1 IRE (7 mV). Blanking level shift with presence or absence of burst, less than 1 IRE (7 mV).

- **a.** Connect a modulated 5–step linearity signal (with AC Bounce on) to the CH–B INPUT, and teminate in 75 Ω . Display the signal with the 2H SWEEP. Turn ON FAST DC REST. Position the blanking level of the signal to the 0 IRE (0 V) line.
- **b. CHECK** that the blanking level does not move when the VARIABLE gain is rotated.
- **c. CHECK** that the blanking level moves when the DC REST is turned off. Leave DC REST OFF. Turn off variable gain.
- **d.** Connect the black burst signal to the EXT REF and terminate the remaining side of the loop–through input.
- e. Connect the function generator output through a X10 (75 Ω) Attenuator to the CH–A INPUT.
- f. Select CH–A and EXT REF.
- **g.** Set the function generator frequency to a 60 Hz (50 Hz PAL) sine wave. Set the amplitude for a 100 IRE (700 mV PAL) 1730–Series display.
- h. Turn ON SLOW DC REST.
- i. **CHECK** that the display amplitude is 80 IRE (560 mV PAL) or greater.
- j. Turn ON FAST DC REST.
- **k.** CHECK that the display amplitude is 10 IRE (70 mV PAL) or less.
- **1.** Remove the function generator output and replace it with the linearity signal and terminate the remaining side of the loop–through input.
- m. Select 2LINE SWEEP.
- n. Turn ON SLOW DC REST.

- **o.** Switch linearity signal APL between 50% and 10% and between 50% and 90%.
- **p.** CHECK that the signal blanking level moves less than 1 IRE (7 mV).
- **q.** Connect the multiburst signal to the CH–A INPUT and terminate the remaining side of the loop–through input.
- r. Switch multiburst generator Burst off and on.
- s. CHECK that the blanking level changes less than 1 IRE (7 mV).
- t. Turn OFF DC REST.
- **u.** Remove the signal cables from the 1730–Series.

13. Check Flat Response

REQUIREMENT – Flat response with 50 kHz as a reference; 250 kHz to 6 MHz within 2%. X5 Flat response with 50 kHz as a reference; 250 kHz to 6 MHz within 5%.

Figure 5-6: Initial equipment setup to check Flat Response.

- **a.** Connect a 50 Ω precision cable and 50 to 75 Ω minimum loss pad from the leveled sine wave to the CH–A input. Teminate the loop–through in 75 Ω .
- b. Select EXT REF.
- **c.** Set the leveled sine wave generator to 50 kHz (reference frequency) and set the output amplitude for a 100 IRE (0.7 V) display amplitude.
- **d. CHECK** the flat response using the 50 kHz response as a reference. Changing the frequency of the sine wave generator, check that the response is within $\pm 2\%$ from 250 kHz to 6 MHz.
- e. Change the 1730–Series VERTICAL GAIN to X5.
- **f.** Set the leveled sine wave generator to 50 kHz and set the output amplitude for a 100 IRE (0.7 V) display amplitude.
- **g. CHECK** flat response using the 50 kHz response as a reference. Check that the amplitude is 100 IRE (0.7 V) ±5% from 250 kHz to 6 MHz.
- **h.** Move leveled sine wave generator output to CH–B and terminate the remaining side of the loop–through INPUT with a 75 Ω termination.
- i. Select CH–B INPUT.
- **j. CHECK** flat response using the 50 kHz response as a reference. Check that the amplitude is 100 IRE (0.7 V) ±5% from 250 kHz to 6 MHz.
- k. Turn off X5 VERTICAL GAIN.
- 1. **CHECK** the flat response using the 50 kHz response as a reference. Check that the response is within $\pm 2\%$ from 250 kHz to 6 MHz.

14. Check PIX MON OUT Frequency Response

REQUIREMENT – PIX MON OUT Frequency Response with a 50 kHz reference; within 3% from 250 kHz to 6MHz.

- **a.** Connect a coaxial cable to the + input on the Peak To Peak Detector Amplifier and connect the other end of the cable to the Peak to Peak Detector Head.
- **b.** Press the + Input button on the Peak To Peak Detector Amplifier.
- **c.** Adjust the Peak to Peak Detector Amplifier + Input Level control fully clockwise.

- **d.** Connect the Peak to Peak Detector Head to the 1730–Series PIX MON output.
- e. Connect the Peak to Peak Detector Amplifier Output to the oscilloscope Vertical input.
- f. Set the 1730–Series GAIN to NORMAL and REF to EXT.
- **g.** Set the sine wave generator to 50 kHz (reference frequency) and adjust the generator amplitude for a 1 Volt display on the 1730 Series.
- h. Set the following controls on the Vertical Input: Volts/Div. 10 mv Coupling dc
- i. Adjust the oscilloscope vertical Position control to place trace on the oscilloscope CRT center line.
- **j.** Check that the frequency response is within 30 mV (\pm 3%) of the reference set on the oscilloscope, as the generator frequency is varied from 250 kHz to 6 MHz.

NOTE. Other checks in this procedure assure that frequency response is within specification; however, the low frequency response can be checked using an LF sine wave generator (see sine wave generator in equipment required list) and performing part d. of this step for 50 kHz to 250 kHz.

15. Check Transient Response

REQUIREMENT – Transient response for the 2T pulse and 2T bar: preshoot 1% or less. Pulse–to–bar ratio: 1:1 within 1%. Overshoot: 2% or less. Ringing: 2% or less. Tilt: 1% or less for field–rate square wave or 25 μ s bar. Variation of the 12.5T modulated pulse (20T for PAL) baseline (Overscan), less than 2% as the display is positioned over the middle 80% of the display (with ac–coupled inputs).

- **a.** Connect the pulse and bar signal to the CH–B INPUT, and terminate the remaining side of the loop–through connector with a 75Ω termination.
- **b.** Select the full amplitude 2T pulse and bar signal from the television test signal generator. Display the signal with the 1LINE SWEEP.
- **c. CHECK** for less than 1% preshoot and less than 2% overshoot and ringing for the pulse and bar transitions.
- d. CHECK for a pulse–to–bar ratio within 1% of unity.
- e. CHECK for less than 1% tilt across the bar.

- **f.** Select the field square wave signal. Display the signal with the 2FLD SWEEP.
- **g. CHECK** for less than 1% tilt across the high APL portion of the display.
- h. Set the 1730–Series VERTICAL to X5 gain.
- i. Select 2LINE SWEEP and SWEEP MAG ON.
- **j.** Display the 12.5T modulated pulse for NTSC and PAL–M (20T for PAL). Position the baseline over the center 140 IRE (1 V).
- k. CHECK that the baseline of the modulated pulse varies less than 2%.

16. Check X5 Transient Response

REQUIREMENT – Transient response for the 2T pulse and 2T bar: preshoot 1% or less. Pulse–to–bar ratio: 1:1 within 2%. Overshoot: 4% or less. Ringing: 4% or less.

- **a.** Connect the black burst signal to the 1730–Series EXT REF and terminate the remaining side of the loop–through input.
- b. Turn SWEEP MAG OFF. Select X5 VERTICAL GAIN and EXT REF.
- **c.** Install the Step Attenuator and insert 14 dB of attenuation in the input signal path.
- **d. CHECK** for 1% or less preshoot and 4% or less overshoot and ringing for the pulse and bar transitions.
- e. CHECK for a pulse–to–bar ratio within 2% of unity.
- f. Disconnect signal from the CH–B INPUT.

17. Check Low Pass Filter Response

REQUIREMENT – Response at 15 kHz does not vary between FLAT and LPASS by more than 1%.

- a. Connect the modulated, 5-step linearity signal to the CH-B INPUT.
- **b.** Select the 100–IRE (100%) FLAT FIELD/ALT LINEARITY setting of the generator.
- c. Select the 1730–Series LPASS FILTER and turn off X5 GAIN (X1).
- d. Switch between LPASS and FLAT.

e. CHECK – that the amplitude of the linearity signal, in LPASS, is within $\pm 1\%$ of the amplitude of the display in the FLAT mode.

18. Check Chroma Filter Response

REQUIREMENT – Response at 3.58 MHz (4.43 MHz for PAL) does not vary between FLAT and CHROMA by more than 1%. Attenuation at 7.2 MHz (8.9 MHz for PAL): greater than 20 dB.

- **a.** Connect the color bar signal to the CH–B INPUT and terminate the remaining side of the loop–through input.
- **b.** Turn the Luminance (Y) portion of the signal off. Unlock the SCH phasing of the generator.
- **c.** Display the signal in FLAT with the 2LINE SWEEP and INT REF. Use the 1730–Series VARIABLE gain control to adjust the amplitude of the largest Chroma packet to equal the amplitude from blanking to 100% peak white. Switch the FILTER to CHROMA.
- **d. CHECK** that the amplitude of the largest chrominance bar is 99 to 101% of the amplitude in part b.
- e. Select FLAT filter. Connect the sine wave generator to the CH–B INPUT and set the frequency to 50 kHz. Adjust the amplitude so that the display is 100 IRE (700 mV for PAL).
- **f.** Set the frequency of the sine wave generator to 7.2 MHz (8.9 MHz for PAL). Select CHROMA filter.
- g. CHECK that less than 10% of the reference amplitude remains.

19. Check Return Loss

REQUIREMENT – Return Loss for INPUT at least 40 dB from 50 kHz to 6 MHz (instrument on or off, any deflection factor setting). Return Loss of the PIX MON OUT at least 30 dB (50 kHz to 6 MHz) with the instrument on.

NOTE. Return Loss Check:

The Return Loss Check needs to be done only if repairs have been made on the Input circuitry.

- a. Connect a precision 50Ω cable from the spectrum analyzer RF Input to the RF Output on the RF Bridge.
- **b.** Connect a precision 50Ω cable from the spectrum analyzer TG Output to the RF Input on the RF Bridge.

- **c.** Select Demod/TG on the spectrum analyzer. Turn on the tracking generator and set the tracking generator fixed level to 0.00 dBm.
- **d.** Set the spectrum analyzer Span/Div to 1 MHz and the Resolution Bandwidth to 30 kHz.
- e. Set the spectrum analyzer Vertical Scale to 10 dB.
- **f.** Set the spectrum analyzer Reference Level to the first major division down from the top on the analyzer display.
- g. Remove one of the cables from the RF Bridge.
- **h.** Set the spectrum analyzer Frequency to 5 MHz and turn the Marker on. Set the Marker to 6 MHz.
- i. Reconnect the cable to the RF Bridge.
- j. Note the Reference Level Readout.
- **k.** Adjust the spectrum analyzer External Attenuation Amplitude (on the 2712 Input menu) by the amount noted in part j. of this step. Note: The Reference Level Readout should now be 0.00 dBm.
- **1.** Connect the precision high-frequency terminator to the Device Under Test connector on the RF Bridge.
- **m.** Check that the frequency response from 0 MHz to 6 MHz is \geq 40 dBm.
- **n.** Return the spectrum analyzer frequency marker to 6 MHz if it was moved.
- o. Remove the precision high-frequency terminator from the RF Bridge.
- **p.** Connect the male-to-male bnc adapter to the Device Under Test connector on the RF Bridge.
- **q.** Connect the Device Under Test connector on the RF Bridge to the 1730–Series CH–A INPUT. Terminate the CH–A loop-through with the same precision high-frequency terminator used in step o.
- r. Select CH–A INPUT.
- s. Check that the Reference Level Readout on the spectrum analyzer is ≥ 40 dBm with the instrument power on and off.
- t. Repeat parts q. through s. for each Input channel (CH–B and EXT REF).
- u. Remove all cables and terminators from the 1730–Series.

- v. Check that the 1730–Series inputs are not terminated and that there is no signal applied. Connect the Device Under Test connector on the RF Bridge to the PIX MON OUT connector.
- **w. CHECK** that the return loss of the PIX MON OUT is better than 30 dB (15.8 mV), from 50 kHz to 6 MHz. Make this measurement with instrument power on and no signal output.

End of Performance Check Procedure.

Adjustment Procedure

The Adjustment Procedure covers only adjustments. Checks, other than those that must be made to ensure a step is completed, are in the Performance Check Procedure. There are actually two Adjustment Procedures, the short–form version is provided for those familiar with the adjustments, while the longer (more detailed) procedure is provided for those who need it.Allow 20 minutes of warm–up time, at normal room temperature (approximately 25° C), before making any adjustments to the instrument.

Short–form Procedure

The Short–Form Adjustment Procedure has the adjustment steps in the same order as the longer form of the procedure. Adjustment circuit numbers are also included with the step title. Note also that the Short-Form Procedure can be used as an index for the long–form.

- **1.** Adjust +5 V (R99)
- 2. Adjust CRT Bias (R58)
- 3. Adjust Geometry (R45), Focus (R11) and Astigmatism (R49)
- 4. Adjust Trace Rotation
- 5. Adjust On–Board Regulated Supplies (R167 and R168)
- 6. Adjust 2Line and 1 µs Sweep Calibration (R660 and R552)
- 7. Adjust 0.2 µs Sweep Calibration (R553)
- 8. Adjust Dual Filter Switching Phase (R636)
- 9. Adjust Magnifier Registration (R661)
- 10. Adjust RGB Offset (R856)
- 11. Adjust RGB Compensation (C953)
- 12. Adjust Output Bias (R489)
- **13.** Adjust Calibration Signal Amplitude (R689)
- 14. Adjust Dual Input dc Level (R492)
- **15.** Adjust X5 Magnifier Registration (R274)
- **16.** Adjust Channel–A Input Compensation (C195) and Flat Response (L180 and L190)

- 17. Adjust Channel–B Input Compensation (C696)
- 18. Adjust X5 Gain HF Response (C372)
- **19.** Adjust Video Out Response (C694)
- 20. Adjust Low Pass Filter (C777 and C775)
- **21.** Adjust Chroma Filter (1730–R683, C683, and C783; 1731–R680, C778, and C784; 1735–R680, C778, C784, R683, C683, and C783)
- 22. Adjust Readout Position (R209)
- 23. Adjust CRT Bias (R58) and Line Select Focus (R245)

Standard Adjustment Procedure

The Front-Panel Presets and Signal Connections for initiating the Adjustment Procedure are shown in Fig. 5–13. The correct settings of the front-panel controls to start this procedure are shown in Table 5–3.

POWER	ON
INTENSITY	Set to preference
FOCUS	
SCALE	
VERTICAL Position	Set later
HORIZONTAL Position	Set later
FILTER	FLAT
REF	INT
INPUT	В
GAIN (switch)	off
DC REST	OFF
MAG	off
SWEEP	2LINE
FIELD	FLD1
LINE SELECT	off

Table 5–3. Preliminary Control Settings

Figure 5-7: Adjustment locations for the Main and Power Supply boards. Numbers in parentheses indicate the step where that adjustment is used.

Preliminary Setup

- **a.** Connect the 1730–Series ac power cord to the variable autotransformer. Turn power on and set the autotransformer for either 110 or 220 Volts.
- **b.** Connect the multiburst signal to the CH–B INPUT and terminate the opposite side of the loop-through with a 75Ω termination.

A1 POWER SUPPLY BOARD

1. Adjust +5 V

- **a.** Connect the DMM negative lead to TP1 (GND) and the positive lead to W1 (+5V).
- **b.** ADJUST R99 (+5V ADJ) for +5.0 V ± 0.5 V.

2. Adjust CRT Bias

- a. Turn the INTENSity control fully counterclockwise.
- **b.** ADJUST R58 (CRT BIAS) so that the display is just extinguished.
- c. Set the INTENSity control to desired level.

3. Adjust Geometry, Focus and Astigmatism

- **a.** Adjust R45 (GEOM) for 35V \pm 1V at pin 1 of J3.
- **b.** Select CH–B INPUT.
- **c.** Set the FOCUS control on the front panel so that it is approximately at the center of its rotation.
- **d. ADJUST** R11 (CENTER FOCUS) and R49 (ASTIG) for the most clearly-defined multiburst display.

4. Adjust Trace Rotation and Geometry

- a. Select CH–A INPUT.
- **b. ADJUST** the front-panel TRACE ROT potentiometer for a level trace across the CRT's 0 IRE line (0.3 V line for PAL).

A3 MAIN BOARD

5. Adjust On-Board Regulated Power Supplies

NOTE. The power supply adjustments should not be made unless the entire procedure is going to be performed. If supplies are within tolerances listed below, any individual adjustment should be possible without having to perform a complete readjustment.

a. Connect the voltmeter ground lead to one of the rear-panel ground lugs and the active lead to the -11.8 V test point. See Fig. 5-8.

Figure 5-8: Segment of the Main board, showing the test points and adjustment locations for the ± 11.8 V supplies.

- **b. ADJUST –** R167 (–11.8 V ADJ) for –11.78 to –11.82 volts.
- c. Connect the voltmeter active lead to the +11.8 V test point. See Fig. 5-8.
- d. ADJUST R168 (+11.8 V ADJ) for +11.78 to +11.82 volts.

6. Adjust 2Line and 1 µs Sweep Calibration

- a. Display the CAL signal on the waveform monitor in the 2LINE SWEEP.
- **b. ADJUST** R660 (Sweep Length) for one cycle of the CAL signal per major division over the center 10 divisions.
- **c.** Turn on the MAG.
- **d.** ADJUST R552 (1 μ s Cal) for one full cycle over the 10 major divisions.
- 7. Adjust 0.2 µs Sweep Calibration
 - a. Set REF to INT and select CH–A INPUT.

b. Loop-through connect the multiburst output from the 1410-Series generator to the CH–A INPUT of the 1730-Series and the Digital Counter. See Fig. 5-9.

Figure 5-9: Equipment setup to adjust 0.2 µs timing.

- **c.** Set the multiburst generator to Low, Continuous, and Manual. Turn Markers off.
- **d.** Adjust the multiburst Frequency for a 5 MHz sine wave as measured on the Digital Counter.
- e. Select the 1730-Series VAR VERTICAL GAIN and adjust the VAR GAIN control for a display amplitude of approximately 6 divisions.
- f. Change the multiburst generator to Composite.
- g. Select 1LINE SWEEP and MAG.

- h. ADJUST R553 for 10 cycles of subcarrier over 10 divisions ±1 minor division. Recheck multiburst generator frequency by switching it back to Continuous.
- i. Disconnect the cable that goes to the Digital Counter and terminate the open side of the CH–A input with a 75 Ω end-line terminator.

8. Adjust Dual Filter Switching Phase

- a. Select 2LINE SWEEP and MAG off.
- **b.** Hold the waveform monitor FILTER button in until both the FLAT and LPASS indicators are lit.
- **c.** Position the tip of the sync pulse, that occurs between the two lines, so that the switching transition is visible.
- **d. ADJUST** R636 (Sw. Ph) to placed the switching transition at the center of the sync tip.

9. Adjust Magnifier Registration

- a. Set the multiburst generator for High Range Multiburst.
- **b.** Turn on the 1730-Series MAG.
- **c.** Use the HORIZONTAL Position control to position the leading edge of the sync pulse to the center major graticule division.
- d. Turn the waveform monitor MAG off.
- e. ADJUST R661 (MAG REG) so that the leading edge of sync is at the center major graticule division. It may be necessary to repeat this step several times to achieve magnifier registration.
- **f.** With the MAG off check that both ends of the trace can be positioned to at least the center of the screen.

10. Adjust RGB Offset

- a. Disconnect the multiburst signal and connect the color bar signal.
- **b.** Set the 1730-Series SWEEP rate to 1LINE.
- c. Set the HORIZONTAL Position control to mid range.
- d. Connect pin 2 of the rear-panel REMOTE socket to ground.
- e. Note that the color bar display compresses to 1/4 to 1/3 of its previous length.

f. ADJUST – R856 (RGB Offset) to center the display at mid screen.

11. Adjust RGB Compensation

- a. Remove the color bar signal from the CH–A INPUT.
- **b.** Input a 10 V, 2 kHz square-wave signal, from the function generator, to pin 1 (with pin 2 still grounded) of the 1730-Series rear-panel REMOTE connector.
- **c.** Connect a probe from the test oscilloscope to the junction of R854 and R755. See Fig. 5-7 for locations.
- d. ADJUST C953 (RGB Comp) for best transient response.
- e. Remove the connections from the REMOTE connector.

12. Adjust Output Bias

- **a.** Set the VERTICAL Position control fully clockwise.
- **b.** Connect the voltmeter lead to the collector (transistor case) of Q280. See Fig. 5-7.
- c. ADJUST R489 (Limit Cent) for +0.8 V.
- d. Set the VERTICAL Position control fully counterclockwise.
- e. Connect the voltmeter lead to the collector (transistor case) of Q289. See Fig. 5-7.
- **f. CHECK** that the voltage is +0.8 V. If it is not, repeat parts a. through f. until the collector voltages are balanced at the same dc level.

13. Adjust Calibration Signal Amplitude

a. Connect the VAC signal to the 1730-Series CH–A INPUT; do not terminate. See Fig. 5-10.

- **b.** Set the VAC for 999.9 mV.
- **c.** Adjust the 1730-Series front-panel V CAL so that the VAC signal is displayed as exactly 1 V p-to-p (140 IRE on the NTSC graticule) on the CRT graticule.
- **d.** Hold the waveform monitor REF button until the CAL signal replaces the function generator signal on the display.
- e. ADJUST R689 (Cal Ampl) so that the Calibrator amplitude is 1 V p-p (140 IRE NTSC) as displayed on the CRT graticule.

14. Adjust Dual Input dc Level

- **a.** Connect the color bar signal through a 75Ω in-line terminator and a Dual Input Coupler to the CH–A and CH–B INPUTs. Do not terminate the loop-through inputs.
- **b.** Connect the black burst signal to the 1730-Series EXT REF and terminate the loop-through input with a 75Ω in-line terminator.
- c. Set the 1730-Series INPUT to BOTH (CH–A and CH–B).
- d. ADJUST R492 (DC Bal) to overlay the CH–A and CH–B displays.

15. Adjust X5 Magnifier Registration

- a. Select CH-A INPUT and GAIN off (no GAIN LED lit).
- **b.** Use the VERTICAL Position control to position the signal blanking level on the graticule baseline.

- c. Select X5 GAIN.
- d. ADJUST R274 (X5 Mag) to reposition blanking level to the baseline.
- e. Select GAIN off and repeat parts b, c, and d until there is no baseline shift when switching between off and X5 GAIN.

16. Adjust Channel-A Input Compensation and Flat Response

a. Connect the multiburst signal through an in-line 75Ω termination to the CH–A INPUT. Connect the black burst signal to the EXT REF and terminate. Connect a 75Ω cable from the 1730-Series PIX MON OUT to the test oscilloscope vertical input (30 MHz vertical plug in). See Fig. 5-11.

Figure 5-11: Equipment setup for adjusting Channel A input compensation.

- **b.** Set multiburst generator to Sweep, High Range, Composite, Markers, and Full Amplitude.
- c. Set the 1730-Series SWEEP to 2FLD and EXT REF.
- d. Set the test oscilloscope Vertical Volts/Div to 100 mV.
- e. ADJUST C195 (CH–A Comp.) for flat response at 6 MHz. See Fig. 5-12.

Figure 5-12: Adjusting for best flat response.

- f. Check the response in the 2–4 MHz region. If it is bumped up:
 ADJUST both L180 and L190 in a small amount (both cores should be adjusted together). If it is dipped: ADJUST both L180 and L190 out a small amount (both cores should be adjusted together).
- **g.** Repeat parts e. and f. until the best response to 6 MHz is achieved. C368 (HF Comp) may need to be adjusted slightly (it affects response in the 6–8 MHz region).
- **h.** Disconnect the multiburst signal from the CH–A INPUT and remove the 75Ω termination from the remaining side of the loop-through connector.

- i. Connect the output of the leveled sine wave generator to the CH–A and CH–B INPUTS, using a precision 50Ω cable, a $50-75\Omega$ minimum loss attenuator, a 75Ω feed through attenuator, and the dual input coupler.
- **j.** Set the leveled sine wave generator Frequency to 50 kHz and adjust its Amplitude for a 100 IRE (NTSC or PAL–M) or 700 mV (PAL) output as displayed on the 1730-Series.
- k. Set the leveled sine wave generator Frequency to 6 MHz.
- **1. ADJUST** C195 (CH–A Comp) for 100 IRE (NTSC and PAL–M) or for 700 mV (PAL).
- **m.** Set the leveled sine wave generator Frequency to 3.58 MHz (NTSC or PAL–M) or 4.43 (PAL) and check for 100 IRE or 700 mV $\pm 2\%$ (2 IRE or 14 mV). Check both frequencies for the 1735.
- **n.** If not in specification at 3.58 or 4.43 MHz, repeat parts e. through g. of this step (as set up by parts a. and b.).

17. Adjust Channel-B Input Compensation

- **a.** Make sure the 1730–Series INPUT is in BOTH (CH–A and CH–B indicators lit).
- **b.** Select 2LINE SWEEP.
- c. Set the leveled sine wave generator Frequency to 6 MHz.
- **d. ADJUST** C696 (CH–B Comp) to overlay the CH–A display with the CH–B display.
- e. Set the leveled sine wave generator Frequency to 3.58 MHz (NTSC or PAL–M) or 4.43 (PAL) and check for 100 IRE or 700 mV $\pm 2\%$ (2 IRE or 14 mV). Check both frequencies for the 1735.

18. Adjust X5 Gain HF Resposnse

- a. Select the CH–A INPUT.
- **b.** Select X5 VERTICAL GAIN.
- c. Set the sine wave generator for 50 kHz.
- d. Select CH–A INPUT, EXT REF, and 1LINE SWEEP.
- e. Adjust the sine wave generator for a displayed amplitude of 100 IRE (or 700 mV).

- **f.** Set the sine wave generator Frequency to 3.58 MHz (NTSC and PAL–M) or 4.43 MHz (PAL). For dual-standard waveform monitors, make the NTSC adjustment only for this step.
- **g. ADJUST** C372 (X5 Comp) for an amplitude of 100 IRE (NTSC and PAL–M) or 700 mV (PAL).
- **h.** Set the sine wave generator frequency to 6 MHz and check that displayed amplitude is still 100 IRE, ± 5 IRE or 700 mV, ± 35 mV.

19. Adjust Video Out Response

- a. Connect the multiburst output to the 1730–Series CH–A INPUT.
- **b.** Set multiburst for high range and full amplitude.
- **c. ADJUST** C694 (Pix Mon Res) for flat display (even tops of the first three multiburst packets) on the test oscilloscope. See Fig. 5-13.

Figure 5-13: Using the high-range multiburst signal to set flatness.

- d. Disconnect the cable from the 1730–Series PIX MON OUT.
- 20. Adjust Low Pass Filter

- a. Set the 1730–Series SWEEP rate to 2LINE.
- **b.** Turn off DC REST.
- c. Connect color bar signal to the CH–A INPUT.
- d. Select INPUT A and LPASS FILTER.
- e. Turn on HORIZONTAL MAG and X5 VERTICAL GAIN.
- **f. ADJUST** C777 (LPASS Filter) for minimum chrominance (minimum trace width on the back porch, following color burst).
- g. Position the sync pulse to the baseline at center screen.
- **h. ADJUST** C775 (LPASS Filter) for the best corner on the leading edge of the sync pulse.

Perform parts i. through m. for dual-standard waveform monitors only.

- i. Connect the output of the sine wave generator to the 1730–Series CH–A INPUT.
- **j.** Set the sine wave generator for 50 kHz.
- **k.** Adjust the sine wave generator for an amplitude, on the 1730–Series, of 100 IRE (700 mV).
- **I.** Set the sine wave generator Frequency to 4.00 MHz.
- m. Re-adjust C777 for minimum chrominance.

21. Adjust Chroma Filter

- a. Connect a color bar signal to the 1730–Series CH–A INPUT.
- **b.** Set the color bar generator for Full Field and turn off Luminance (Y) and Setup. Set color bar amplitude to 75%.
- c. Set the 1730–Series to CH–A, FLAT FILTER, 1LINE SWEEP, DC REST OFF, VERTICAL GAIN VAR, and SWEEP MAG off.
- **d.** Use the 1730–Series VAR to set the displayed amplitude of the largest color bar packet to be from blanking level to peak white (100 IRE for NTSC and PAL–M, or 700 mV for PAL).
- e. Change 1730–Series FILTER to CHRM.
- f. ADJUST R683 (NTSC and PAL–M Chroma Filter Gain) or R680 (PAL Chroma Filter Gain) so that the amplitude of the largest color packet is again 100 IRE or 700 mV, depending on the color standard

employed. For dual-standard waveform monitors, make both the NTSC and PAL adjustments, using the appropriate signal generator.

- g. ADJUST C683 (3.58 NTSC and PAL–M) or C778 (4.43 PAL) for the squarest envelope (minimum burst envelope decay time). It may be necessary to readjust C783 (NTSC or PAL–M) or C784 (PAL) for maximum amplitude. For dual-standard waveform monitors, make both adjustments, using the appropriate signal generator.
- **h.** It may be necessary to perform parts f. and g. several times before reaching the optimum setting for both Gain and Chroma Filter Compensation.
- i. Turn off VAR GAIN
- j. Turn on Color Bar Luminance.

22. Adjust Readout Position

- **a.** Select FLAT FILTER and 2LINE SWEEP for the 1730–Series.
- b. Set the 1730–Series FOCUS control for optimum display definition.
- c. Select LINE SELECT ON and LINE 19 (CRT readout).
- d. Set the front panel Readout to midrange.
- e. Position the display to overlay the waveform blanking level on the CRT blanking level line, and position the center sync pulse on the sync amplitude measurement scale.
- **f. ADJUST** R209 (Y-Axis Position) so that the 19 in the readout is just above the peak white graticule line (110 IRE or 1.10 V).
- **g.** Turn off the Line Select.

23. Adjust CRT Bias and Line Select Focus

- a. Turn the INTENSity control fully counterclockwise.
- b. ADJUST A1R58 (CRT Bias) until the display just disappears.
- c. Turn LINE SELECT ON, line 19.
- d. Adjust the front panel INTENSity control fully clockwise.

- e. ADJUST A3R245 (LS Focus) for the optimum display definition.
- **f. ADJUST** the front panel READOUT screwdriover adjustment to match the readout intensity to the Display Intensity.
- g. Turn LINE SELECT Off.

End of Adjustment Procedure.

Maintenance

Section 6 Maintenance

This section contains instructions for preventive maintenance, general troubleshooting, Serial Port and LED Driver diagnostics, and corrective maintenance. If the instrument does not function properly, troubleshooting and corrective measures should be taken immediately to circumvent additional problems.

Preventive Maintenance

Preventive maintenance consists of cleaning, visual inspection, performance checking, and, if needed, readjustment. The preventive maintenance schedule established for the instrument should be based on the environment in which it is operated and the amount of use. Under average conditions, scheduled preventive maintenance should be performed every 2000 hours of operation.

Cleaning

NOTE. Cleaning Rosin:

A 2% RMA flux content solder is recommended for making repairs in this instrument. Cleaning of rosin residue is not recommended. Most cleaning solvents tend to reactivate the rosin and spread it under components where it may cause corrosion under humid conditions. The rosin residue, if left alone, does not exhibit these corrosive properties.

The instrument should be cleaned often enough to prevent dust or dirt from accumulating. Dirt acts as a thermal insulating blanket that prevents effective heat dissipation, and can provide high–resistance electrical leakage paths between conductors or components in a humid environment.

Exterior. Clean the dust from the outside of the instrument by wiping with a soft cloth or small brush. A brush is especially useful to remove dust from around the selector buttons, knobs, and connectors. Hardened dirt may be removed with a cloth dampened in water that contains a mild detergent. Abrasive cleaners should not be used.

<u>CRT.</u> Clean the CRT protective shield, light filter, and CRT face with a soft, lint– free cloth dampened in denatured alcohol.

Interior. Clean the interior of the instrument by loosening the accumulated dust with a dry, soft brush. Once the dirt is loosened remove it with low–pressure air

(high–velocity air can damage some parts). Hardened dirt or grease may be removed with a cotton–tipped applicator dampened with a solution of mild detergent and water. Abrasive cleaners should not be used. If the circuit board assemblies must be removed for cleaning, follow the instructions for removal/replacement under the heading of Corrective Maintenance.

After cleaning, allow the interior to thoroughly dry before applying power to the instrument.

CAUTION. Cleaning fluids:

Do not allow water to get inside any enclosed assembly or component. Do not clean any plastic materials with organic cleaning solvents, such as benzene, toluene, xylene, acetone, or similar compounds, because they may damage the plastic.

Visual Inspection After cleaning, carefully check the instrument for defective connections, damaged parts, and improperly seated transistors or integrated circuits. The remedy for most visible defects is obvious; however, if heat–damaged parts are discovered, determine the cause of overheating before replacing the damaged part, to prevent additional damage.

Periodic checks of the transistors and integrated circuits are not recommended. The best measure of performance is the actual operation of the component in the circuit.

Static-Sensitive
ComponentsThis instrument contains electrical components that are susceptible to damage
from static discharge. Static voltages 1 kV to 30 kV are common in unprotected
environments. Table 6–1 shows the relative static discharge susceptibility of
various semiconductor classes.

Relativ	e Susceptibility Levels	Voltage
2	ECL	200V – 500V
3	SCHOTTKY SIGNAL DIODES	250 V
4	SCHOTTKY TTL	500 V
5	HF BIPOLAR TRAN- SISTORS	400 to 600 V
6	JFETS	600 to 800 V
7	LINEAR μ CIRCUITS	400 to 1000 V est.

Table 6–1: Static Susceptibility

Relative Susceptibility Levels		Voltage
8	LOW POWER SCHOTT- KY TTL	900 V
9	TTL	1200 V

Table 6–1: (Cont.)Static Susceptibility

Observe the following precautions to avoid damage:

1. Minimize handling of static-sensitive components.

2. Transport and store static–sensitive components or assemblies in their original containers, on a metal rail, or on conductive foam. Label any package that contains static–sensitive components or assemblies.

3. Discharge the static voltage from your body, by wearing a wrist grounding strap, while handling these components. Servicing static–sensitive assemblies or components should be done only at a static–free work station by qualified personnel.

4. Nothing capable of generating or holding a static charge should be allowed on the work station surface.

5. Keep the component leads shorted together whenever possible.

6. Pick up the components by the body, never by the leads.

7. Do not slide the components over any surface.

8. Avoid handling components in areas that have a floor or work surface covering capable of generating a static charge.

9. Use a soldering iron that is connected to earth ground.

10. Use only special antistatic, suction, or wick-type desoldering tools.

Performance Checks and
ReadjustmentsInstrument performance should be checked after each 2000 hours of operation, or
every 12 months, if used intermittently. This will help to ensure maximum
performance and assist in locating defects that may not be apparent during
regular operation. The Performance Check Procedure and the Adjustment
Procedure are in Section 5.

Troubleshooting

The material contained here is general and is not intended to cover specific cases. Note that the manual itself is considered a troubleshooting aid, and as such a brief discussion of its content is in order. The procedural information that appears as <u>General Troubleshooting Techniques</u> should be familiar to most technicians; however, a quick review may save some time and reduce "wheel spinning."

Foldout Pages The foldout pages at the back of the manual contain information that is useful in troubleshooting the instrument. Block and schematic diagrams, circuit board illustrations, and parts locating charts are found there.

Diagrams. Schematic diagrams are the most often used troubleshooting aids. The circuit number and electrical value of each component is shown on the diagram. The first tabbed page has definitions of the symbology used on the schematic diagrams. Refer to the Replaceable Electrical Parts list for a complete description of each component. Circuits that are mounted on circuit boards or assemblies are enclosed in a border, with the name and assembly number shown on the border.

NOTE. Change Information:

Check the Change Information section in the rear of the manual for corrections and modifications to the instrument and the manual.

<u>**Circuit Board Illustrations.</u>** Electrical components, connectors, and test points are identified on circuit board illustrations, which are located on the page facing the first schematic diagram for that board. Circuit board illustrations are assigned location grids along the left side and top, which are used with the parts locating charts to rapidly locate the components.</u>

Parts Locating Charts. The parts locating charts are used in conjunction with the location grids on the board illustrations and on the schematics. There is one locator chart that shows all of the parts on the board. This locator chart shows which schematic the part is shown on, in addition to the board and schematic grid locations for that part. In addition, there are locator charts facing each schematic page that gives the board and schematic grid locations lists for only the parts depicted on that schematic page.

Assembly and Circuit Numbering. The circuit board assemblies are assigned assembly numbers. Figure. 6-1 shows the circuit board assembly locations for this instrument.

A2 Front Panel Board

Figure 6-1: Circuit board assembly locations.

Adjustment Locations. Section 5 has illustrations that have the adjustments and test points called out as calibration and troubleshooting aids.

Parts Lists There are two separate parts lists in this manual. The Replaceable Electrical Parts list (Section 8) precedes the schematic diagrams and circuit board illustrations. The Replaceable Mechanical Parts list (Section 10), accompanied by exploded view drawings, follows the schematic diagrams and circuit board illustrations.

<u>Replaceable Electrical Parts.</u> This list is arranged by assembly as designated in ANSI Standard Y32.16–1975. The list begins with the part numbers for the major assemblies (etched circuit boards). Each circuit board is identified by an A# (Assembly Number).

The circuit numbers of the individual components in the parts list are made up by combining the assembly number with the individual circuit number.

EXAMPLE: R117 on Assembly (circuit board) A3 would be listed in the Replaceable Electrical Parts list as A3R117.

NOTE. Check Parts Lists:

Always consult the parts list for part numbers and descriptions when ordering replacement parts. Some parts may have been replaced or have a different part number in an individual instrument. Also check the "Change Information" at the back of the manual for the most recent changes.

<u>Replaceable Mechanical Parts.</u> This list is arranged so that it corresponds to the exploded view drawing for major instrument components. The list and

exploded view drawing comprise Section 10 of this manual. Standard Accessories, which are also included in the parts list, are also in the exploded view drawing.

Major Assembly Interconnection

Signals and power supply voltages are passed through the instrument with a system of interconnecting cables. The connector holders, on these cables, have numbers that identify terminal connectors; numerals are used from pin 2 up. A triangular key symbol is used to identify pin 1 on the circuit board to assist in aligning connector with correct square pins. Fig. 6-2 shows the numbering scheme (and the triangular marking) on the etched circuit board.

Figure 6-2: Multiple pin connectors used in the 1730–Series Waveform Monitor.

General Troubleshooting Techniques

The following procedure is designed to assist in isolating problems, which in turn expedites repairs and minimizes down time.

1. <u>Ensure that the malfunction exists in the instrument</u>. This is done by making sure that the instrument is operating as intended by Tektronix (see Operating Instructions in Section 2), and by checking that a malfunction has not occurred up stream from the waveform monitor.

2. <u>Determine and evaluate all trouble symptoms</u>. This is accomplished by isolating the problem to a general area such as an assembly. The block diagram is a valuable aid in signal tracing and circuit isolation.

CAUTION. Probes and Meter Leads:

Use extreme care when probing with meter leads or probes, because of the high component density and limited access within the instrument. The inadvertent movement of leads or a probe could cause a short circuit or transient voltages capable of destroying components.

3. <u>Determine the nature of the problem</u>. Attempt to make the determination of whether the instrument is out of calibration or if there has been a component failure. Once the type of failure has been determined, proceed on to identify the functional area most likely at fault.

4. <u>Visually inspect the suspect assembly for obvious defects</u>. Most commonly these will be broken or loose components, improperly seated components, overheated or burned components, chafed insulation, etc. Repair or replace all obvious defects. In the case of overheated components, determine the cause of overheating and correct the cause before re-applying power.

5. <u>Use successive electrical checks to locate the source of the problem</u>. The primary tool for problem isolation is the oscilloscope. Use the Performance Check Procedure (located in Section 5) to determine if a circuit is operating within specifications. At times it may be necessary to change a calibration adjustment to determine if a circuit is operational, but since this can destroy instrument calibration, care should be exercised. Before changing an adjustment, note its position so that it can be returned to its original setting.

6. <u>Determine the extent of the repair</u>. If the necessary repair is complex, it may be advisable to contact your local Tektronix field office or representative before continuing. If the repair is minor, such as replacing a component, see the parts list for replacement information. Removal and replacement procedures for the assemblies can be found under Corrective Maintenance.

CAUTION. Removing Components:

Always remove the assembly from the instrument prior to attempting to replace a soldered in component. See Corrective Maintenance for the correct procedure.

Specific Troubleshooting Techniques

The 1730–Series Waveform Monitor has two areas where ordinary troubleshooting techniques do not apply.

This instrument contains internal diagnostics for the serial port and the front– panel LED indicators. Specific instructions for these diagnostics follow the Power Supply troubleshooting procedure.

Power Supply The power supply is of the high–efficiency type and requires a specific troubleshooting procedure and an isolation transformer to avoid personal danger or instrument damage.

The 1730–Series power supply presents special troubleshooting problems, if a fault occurs. Besides having a sizeable area where dangerous potentials can be contacted, the type of circuitry employed can not be trouble shot by conventional means.

WARNING. Read Instructions:

Do not attempt to troubleshoot the 1730–Series power supply without reading these instructions.

Troubleshooting Procedure

NOTE. Read Theory of Operation:

A review of the power supply Theory of Operation is recommended before attempting repairs.

The equipment needed to troubleshoot the power supply:

- Digital Multimeter (DMM), with a diode check function
- Oscilloscope
- 0 to 20 VDC Variable Power Supply

- Clip Lead to short across a component
- High Voltage Probe, ≥ 1 G Ω input resistance
- **Introduction** The Troubleshooting Procedure for the Power Supply (Assembly A1) is split into two sections, the Low Volts and High Volts Supplies. Start the procedure by determining which section of the power supply the problem is in. Apply ac power and turn on the power supply. From Table 6–2, determine which symptom the power supply exhibits and refer to the corresponding procedure.

Table 6–2: Powe	r Supply	Fault S	ymptoms
-----------------	----------	---------	---------

Symptom	Procedure
Line fuse open	Rectifier/Switcher Check (Low Volts)
Power Supply cycles OFF/ON	Output Check (Low Volts) or High Voltage Oscillator Check (High Volts)
Does not power up	Control Circuit Check (Low Volts)
+5 V not regulating	Error Amplifier Check (Low Volts)
Improper CRT display	High Volts Supply

Low Volts Supply

NOTE. Low Volts Supply Load:

A 20 Ω , 2 watt resistor should be used as a load for the Low Volts Supply. Disconnect J4 and connect the 20 Ω resistor between W1 (+5 V) and TP1 (secondary ground).

1. Preliminary Checks

a. A properly functioning and loaded Low Volts supply will output the voltages listed in Table 6–3. Use the DMM to measure the voltages between TP1 and the voltage test points. If the supply is not regulating properly, continue with the procedure.

Table 6–3: Low Volts Supply Voltages

Test Point	Voltage Range
W1 – (+5 V)	+4.88 to +5.12 V
W4 – (+15 V)	+14.0 to +16.0 V

Test Point	Voltage Range
W3 – (–15 V)	–14.0 to –16.0 V
W2 – (+40 V)	+39.0 to +41.0 V

Table 6–3: (Cont.)Low Volts Supply Voltages

NOTE. Low Volts Supply Power Connection:

The Low Volts power supply troubleshooting is performed without applying ac power.

- **b.** Disconnect ac power from the instrument. Disconnect the instrument from the Power Supply by removing the jumper from J4.
- **c.** Use the digital multimeter to measure the voltage between TP2 and the tab (drain) of Q9. Check that the voltage is near 0 V.

CAUTION. Dangerous Voltages:

Do not proceed until the the drain of Q9 is near 0 V. Dangerous voltage potentials are present in the circuit until the capacitors discharge.

2. Rectifier/Switcher Check

- **a.** Use the digital multimeter to measure the voltage between TP2 and the tab (drain) of Q9. Be sure the voltage is near 0 V before proceeding.
- **b.** Unsolder and lift one end of R102.
- c. With the negative lead of the digital multimeter connected to TP2 and the positive lead connected to the tab of Q9, measure the circuit resistance. A resistance of less than 20 k Ω indicates a shorted mosfet (Q9). If the mosfet is shorted, replace it and perform the Control Circuit Check.
- **d.** Using the digital multimeter diode test function, test CR21, CR22, CR23, and CR24 for shorts. Diode replacements must be fast reverse recovery (300 ns) types to reduce conducted noise.
- e. Reconnect the lifted end of R102.

3. Output Check

a. Connect the negative output from the 20 V DC Power Supply to TP1. Connect the positive output to W4 (+15 V). The circuit should draw less than 20 mA. Excessive current draw can be caused by CR11 or U2 (High Volts power supply).

- **b.** Connect the negative output from the 20 V DC Power Supply to TP1. Connect the positive output to W2 (+40 V). The circuit should draw less than 20 mA. Excessive current draw can be caused by CR14 or Q6 (High Volts power supply).
- **c.** Connect the positive output from the 20 V DC Power Supply to TP1. Connect the negative output to W3 (–15 V). The circuit should draw less than 20 mA. Excessive current draw can be caused by CR12.
- **d.** Connect the negative output from the 5 V DC Power Supply to TP1. Connect the positive output to W1 (+5 V). The circuit should draw less than 20 mA. Excessive current draw can be caused by CR13 or Q1 and Q2 (High Volts power supply).

4. Control Circuit Check

- **a.** Connect the negative output from the 20 V DC Power Supply to TP2. Connect the positive output to the cathode of CR17. Short C47 with a clip lead. Connect the oscilloscope probe ground to TP2.
- **b.** Table 6–4 lists the signal present in a properly functioning control circuit.

Circuit Location	Signal
U5, pin 1	Approximately 5 VDC
U5, pin 2	Approximately 2 VDC
U5, pin 3	0 V
U5, pin 4	80 kHz triangle wave, 2 V p-p
U5, pin 6	80 kHz square wave, 18 V p-p
U3, pin 1	80 kHz square wave, 5 V p-p
U3, pin 2	2.1 VDC
U3, pin 6	2.9 VDC
U3, pin 7	Approximately 5 VDC
U4, pin 13	80 kHz repetition rate, 300 ns width, approximately 3 V p-p
Q8, collector	80 kHz repetition rate, 400 ns width, switching from 5 V to approximately 2 V

 Table 6–4: Control Circuit Test Points

c. Remove the clip lead from across C47.

5. Error Amplifier Check

- **a.** Connect the negative output from the variable DC power supply to TP1. Connect the positive output to W1 (+5 V).
- **b.** Connect the negative output of another variable DC power supply to TP1. Connect the positive output to W4 (+15 V). Set the variable power supply to 20 VDC.
- c. Connect the digital multimeter between TP1 and the cathode of CR15.
- **d.** Set the variable DC power supply connected to W1 (+5 V) to 4.8 V. The cathode of CR15 should be approximately 20 V.
- e. Set the variable DC power supply connected to W1 (+5 V) to 5.2 V. The cathode of CR15 should be approximately 2 V.
- **f.** If this check did not reveal the cause for the +5 V supply not regulating, refer to the Output Check and the Control Circuit Check.

High Volts Supply

1. Preliminary Checks

a. Table 6–5 lists the High Volts Supply fault symptoms and procedures.

Symptom	Procedure
Unable to focus CRT using the front-panel control	Focus Amplifier Check
Unable to adjust CRT intensity using the front-panel control	Z-Axis Amplifier Check Grid Drive Check
No CRT display	High Voltage Oscillator Check CRT Voltage Check

 Table 6–5: High Volts Supply Fault Symptoms

b. Load the Low Volts Supply with the instrument, or with the 20Ω resistor as detailed at the beginning of the Troubleshooting Procedure.

2. Focus Amplifier Check

- **a.** Unsolder and lift one end of R24.
- **b.** Power up the power supply.

- **c.** Using the digital multimeter, measure the voltage between TP1 and the collector of Q1. It should be approximately –140 V.
- **d.** Reconnect the lifted end of R24.

3. Z-Axis Amplifier Check

- **a.** Unsolder and lift one end of R8.
- **b.** Power up the power supply.
- **c.** Using the digital multimeter, measure the voltage between TP1 and the collector of Q4. It should be approximately +10 V.
- **d.** Short together the base and emitter of Q5. The collector of Q4 should be approximately +100 V.
- e. Reconnect the lifted end of R8.

4. Grid Drive Check

- **a.** Turn off the power supply. Use the diode check on the digital multimeter to test CR1, CR2, CR3, CR5, and CR6 for shorts.
- **b.** Power up the power supply.
- **c.** Using the digital multimeter, measure the voltage between TP1 and the cathode of CR5. It should vary between approximately +75 and +200 V as R58 (CRT Bias) is adjusted.
- **d.** Connect the oscilloscope probe to the anode of CR5 and the probe ground to TP1. The signal should be a clipped sine wave of +75 to +200 V p-p.

5. High Voltage Oscillator Check

- **a.** Connect the oscilloscope probe to T1 pin 3 (Q6 collector) and the probe ground to TP1. Power up the supply. The signal should be a +60 V p-p, 22 kHz sine wave.
- **b.** Check the voltages listed in Table 6–6 using the digital multimeter:

 Table 6–6: High Voltage Oscillator Test Points

Circuit Location	Voltage
T1, pin 4	Approximately +40 V
T1, pin 13	Less than +2 V

Circuit Location	Voltage
U2, pin 2	Approximately +4.8 V
U2, pin 6	+4 to +11 V
CR9, cathode	Approximately +100 V

Table 6-6: (Cont.)High Voltage Oscillator Test Points

6. CRT Voltage Check

NOTE. High Voltage Probe:

This check requires a high voltage probe having an input resistance of 1 G Ω or more.

- a. Connect the high voltage probe ground to TP1.
- **b.** Load the Low Volts supply with the instrument, or with a 20 Ω , 2 watt resistor loading the 5 V supply.
- **c.** Power up the power supply.
- **d.** Use the high voltage probe to measure the voltage at the anode of CR4. It should be approximately -2350 V.
- e. Measure the voltage at the anode end of CR3. It should be 50–150 V more negative than the reading from the anode of CR4.

Serial Port and LED Driver Diagnostics

A non-destructive diagnostic program is built into the 1730–Series. All that is required to perform these diagnostics is a male, 9–pin, sub–miniature D–type connector with pins 8 and 9 connected together. The procedure contained here will isolate non–operating front–panel indicators and open or shorted receive and transmit lines in the serial interface.

1. Turn off instrument POWER.

2. Install the male, sub-miniature D-type connector on the rear-panel AUXILIARY connector.

3. Hold in the LINE SELECT and POWER switches until all front-panel indicators light. This step checks:

- a. LEDs and LED Drivers
- b. Interface continuity (RXD in and TXD out)

When all indicators are lit there is continuity from the Microprocessor, out through the TXD Buffer, and back through the RXD Buffer. If all front–pan-

el indicators do not light, check indicator or Driver. If indicators blink, check RXD Buffer (U809B) or TXD Buffer (U809C).

4. Remove the male connector from the rear-panel AUXILIARY connector and check for blinking indicators. This step checks for shorted RXD and TXD lines.

If lights remain on, the RXD and TXD lines are shorted together.

5. Turn off POWER. This ends the Diagnostic Procedure. When the 1730–Series is powered up again it will be operating in the normal waveform monitor configuration.

Corrective Maintenance

NOTE. Warranty Repairs:

No repair should be attempted during the warranty period.

NOTE. Solder:

A 2% RMA flux content solder is recommended for making repairs in this instrument. Cleaning of rosin residue is not recommended. Most cleaning solvents tend to reactivate the rosin and spread it under components where it may cause corrosion under humid conditions. The rosin residue, if left alone, does not exhibit these corrosive properties.

Obtaining Replacement
PartsReplacement parts are available through the local Tektronix field office or
representative. However, many common electronic parts are available through
local sources. Using a local source, where possible, will eliminate shipping
delays.

Changes to Tektronix instruments are sometimes made to accommodate improved components, as they become available, and to improve circuit performance. Therefore, it is important to include the following information when ordering parts:

- 1. Part Number
- 2. Instrument Type or Number
- 3. Serial Number

4. Modification or Option Number (if applicable)

If a part has been replaced with a new or improved part, the new part will be shipped (if it is a direct replacement). If not directly replaceable the local Tektronix field office or representative will contact the customer concerning any changes. After any repair, circuit readjustment may be required.

Mechanical Disassembly/Assembly

The instructions contained here are for disassembly. Re–assembly is performed by reversing the order of the steps used to disassemble the instrument.

WARNING. Unplug Power Cord:

Before attempting any disassembly of the instrument be sure to disconnect the power cord.

CAUTION. Rear Panel Screws:

Do not re-insert screws in the rear panel when the instrument is removed from the cabinet.

NOTE. Screw Types:

All screws, unless otherwise noted, are $TORX^{\otimes}$ screws and can be removed with a T15 screwdriver tip (Tektronix part number 003-0966-00). The exception is #2 Pozidrive[®] screws which can be removed with a #1 Pozidrive[®] tip (003-0443-00).

Bezel Removal 1. Remove the two bezel screws. See Figure. 6-3.

2. Grasping the bottom of the bezel, pull straight out and upward. There are two hinges at the top of the bezel that hold it in place; once the bezel is at an approximate 45° angle with the front panel they will disengage.

3. To replace, reverse the procedure.

Figure 6-3: Bezel removal.

Graticule Light Removal and Replacement

For graticule light removal and replacement, tweezers with curved, serrated tips are recommended. For example, Miltex PL312,6–100 (equivalent to PL312) or PL317 (longer than PL312).

CAUTION. Bulb Removal:

Needle-nosed pliers are not recommended.

Replacement bulbs are supplied with this instrument as Standard Accessories. Additional bulbs can be purchased from Tektronix (see Replaceable Electrical Parts list) or from local electronics distribution sources.

Procedure

1. Remove the bezel according to the preceding instructions.

2. To remove a bulb, position the tweezer tips on the thin, flat portion of the bulb (close to the plastic socket). Carefully pull the bulb straight out.

3. To install a bulb, hold it with the tweezers as described in step 2, position it in front of the socket, and push the bulb with your finger until it snaps into place.

4. Replace the bezel.

CRT Removal

1. Remove the bezel.

WARNING. The CRT may retain a dangerous charge. Ground the conductor of the anode to discharge the CRT. Do not allow the conductor to touch your body or any circuitry.

- 2. Slide a screwdriver with an insulated handle under the anode cap on the side of the CRT, and ground the anode to the chassis, to discharge the CRT. DO NOT touch the metal shaft of the screwdriver while doing this. Disconnect the anode cap by prying it gently away from the CRT.
- **3.** Disconnect J225 (trace rotation) on the Main board and push the connector through the hole in the board.
- **4.** The CRT can now be pulled straight out (some pressure may be needed). The CRT shield, along with the grommet around its front and the rubber manchet around its back, should come out with the CRT.

CRT Replacment

- 1. If the CRT is to be replaced, remove the metal shield from the neck of the old CRT and place it around the neck of the new CRT, with the WARNING sticker towards the top of the instrument. This should place the opening in the grommet on the front edge of the shield towards the bottom of the instrument. Ensure that the rubber manchet is on the back edge of the shield.
- 2. Slip the CRT part way back into position and feed the trace rotation wires (and plug) back through the hole in the Main board.

WARNING. The CRT may retain a dangerous charge. Ground the the anode connector to discharge the CRT. Do not allow the conductor to touch your body or any circuitry.

- 3. Use a screwdriver to ground the anode connector on the CRT to the chassis.
- **4.** Slide the CRT into the instrument, guiding the rubber manchet on the end of the shield into the rear CRT support.
- **5.** Align the socket on the A10 CRT Socket board with the pins and key on the CRT. Gently push the CRT and the socket board together until the CRT pins are fully seated in the socket.

- **6.** Replace the trace rotation connector (J225, Main board), and snap the anode lead onto the anode connector on the side of the CRT.
- 7. Wipe the faceplate of the CRT to remove fingerprints, then replace the bezel. If the fit is too tight to allow the bezel to go into position, or if the CRT has a loose fit after the bezel is completely tightened down, then the rear CRT support must be repositioned.

To reposition the rear CRT support, loosen the two nuts that hold the support in place. With the CRT and bezel in place, push the support towards the front of the instrument until it is snug against the rubber manchet on the rear of the CRT shield. Tighten the two support nuts.

1. Remove the five rear screws. See Fig. 6-4.

2. Unsolder the six bnc's and one ground connection. (If 1700F10 Field Upgrade is installed, unsolder leads from the battery connector.)

3. Pull the rear panel free from the chassis; be careful not to pull the unsoldered wires.

4. To replace, reverse the procedure.

Figure 6-4: Rear panel securing screws.

Removing the Front Panel and the Front Panel Circuit Board

Removing the Rear Panel

1. Remove the blue multi-wire connector from J154.

2. Remove the two screws holding the board in place. See Fig. 6-5 for location.

3. Remove the board by slipping it through the front–panel opening.

- 4. To access the Front Panel board components:
 - a. Remove the knobs from the front.
 - b. Remove the four screws from the rear.
 - c. The board should now separate from the front panel making the components accessible.
- 5. To re–assemble, reverse the procedure.

Figure 6-5: Screws that hold the Front Panel circuit board (A2) in place.

Removing the Main Board

1. Remove the plugs from the following connectors: J107 to the Front Panel board, J4 on the Power Supply board, and J225 on the Main board (the trace rotation leads to the CRT).

2. Unsolder the leads to the six bnc connectors and three ground from the rear panel, the two horizontal CRT leads (red and green), the PIX MON OUT, and the two vertical CRT leads (blue and brown).

3. Slip the CRT and trace rotation leads through the appropriate holes in the Main board.

4. Remove the eight screws that are holding the board in place. See Fig. 6-6 for their locations.

Figure 6-6: Screws holding the Main circuit board (A3) in place.

5. Remove the board by sliding it toward the rear panel until the toe of the board clears the front, then lift out.

- 6. To replace the Main board, lay the board flat and slide it back into place.
- 7. To complete the replacement of the board, reverse the rest of the steps.

Removing the Power Supply Board

- 1. Remove the plug from J4 on the Power Supply board, This is the connection to the Main board.
- 2. Remove the anode connection from the CRT and discharge it to ground.

WARNING. CRT Retained Charge Hazard:

The CRT may retain a dangerous charge. Ground the conductor of the anode to discharge the CRT. Do not allow the conductor to touch your body or any circuitry.

3. Unsolder the following connections: J1 pins 1 through 4, J3 pins 1 through 4, and the focus lead at J11. (If a 1700F10 Field Upgrade Kit is installed, unsolder leads to the rear-panel DC Connector.)

4. Disconnect the ac line filter from the rear panel by unscrewing its two mounting screws.

5. Use a #1 Pozidrive® tip to disconnect the power on/off switch from the front casting.

6. Remove the seven screws that are holding the Power Supply board down. See Fig. 6-7.

- 7. Remove the board by sliding it forward and lifting it up.
- 8. To replace the board, reverse this procedure.

Ground strap

Remove these screws to remove this board

Figure 6-7: Screws holding the Power Supply circuit board (A1) in place.

Repackaging

Identification Tag	If the instrument is to be shipped to a Tektronix Service Center for service or repair, attach a tag to the instrument showing:
	1. Owner (with complete address) and the name of the person at your firm that can be contacted.
	2. Instrument serial number and a description of the service required.
Repackaging for Shipment	Repackage the instrument in the original manner to provide adequate protection (see Fig. 6-8). If the original packaging is not available or is unfit for use, repackage the instrument as follows:
	1. Obtain a corrugated cardboard carton whose inside dimensions are at least six inches greater than the dimensions of the instrument to allow room for cushioning. The shipping carton should have a test strength of at least 275 pounds.
	2. Surround the instrument with polyethylene sheeting to protect the finish.
	3. Cushion the instrument on all sides by tightly packing dunnage or urethane foam between the carton and the instrument. Allow three inches on all sides for cushioning.
	4. Seal the carton with shipping tape or an industrial stapler.

Figure 6-8: Repackaging a 1730–Series instrument.

Options

Section 7 Options

CRT Options	The standard instrument is shipped with a P31 (green) phosphor CRT installed. If Option 74 is ordered, the instrument is shipped with a P4 (white) phosphor crt installed. The Option 74 CRT part number is given at the end of the Replaceable Electrical Parts list.
Power Cord Options	Any of the following power cord options can be ordered for the 1730–Series. If no power cord option is ordered, instruments are shipped with a North American 125 V power cord and one replacement fuse.
	Option A1 Universal Europe 220V/16A Locking Power Plug (power cord and one replacement fuse)
	Option A2 United Kingdom 240V/15A Power Plug (power cord and one replacement fuse)
	Option A3 Australian 240V/10A Power Plug (power cord and one replacement fuse)
	Option A4 North American 250V/18A Power Plug (power cord and one repalcement fuse)
	Option A5 Swiss 240V/6A Power Plug (power cord and one replacement fuse)
	Unless otherwise specified, power cords for use in North America are UL listed and CSA certified. Cords for use in areas other than North America are approved by at least one test house acceptable in the country to which the product is shipped. Power cord part numbers are shown on the pull–out in Section 10.
Cabinets	
	All of the Safety and EMI tests used to qualify the 1730–Series were performed in a cabinet. There are two optional cabinets and a dual rack adapter available for the installation of these instruments. Only a brief description is provided here, for more information contact a Tektronix field office or distributor.
Plain Cabinet (1700F00)	This is a plain, silver–grey cabinet that is designed for permanent mounting. The pattern of ventilating holes in top, bottom, and sides provides adequate air circulation for any heat generated within the instrument. When being permanently mounted, care must be taken to allow the free circulation of air to and

	from these ventilating holes. A drawing of this cabinet, that can be used in mounting the cabinet, is located in Section 3 (Installation) of this manual.
Carrying Case (1700F02)	This is a silver–grey, metal cabinet, with feet and carrying handle designed for portable applications. A TEKTRONIX BP1 can easily be mounted to this cabinet to provide a 12 Vdc power source for portable operation.
Side-by-Side Rack Adapter (1700F05)	This is a 19–inch, rack mounting adapter that accepts two 1700–Series instru- ments in a side–by–side configuration. Instrument cabinets are 1700F00 that are connected together for this installation. If only one 1700–Series instrument is to be installed in the Side–by–Side Rack Adapter, a blank panel (1700F06) can be installed for air flow protection, and appearance.
Blank Panel (1700F06)	When only one side of a 1700F05 dual rack adapter is used, this blank panel can be installed in the other half to improve appearance and protect air flow.
Utility Drawer (1700F07)	When only one side of a 1700F05 dual rack adapter is used, an alternate to the 1700F06 blank panel is the 1700F07 utility drawer. This drawer provides over 1/3 cubic foot of storage space for accessories. The drawer kit includes a tray, which is permanently mounted to the 1700F05. The drawer opens and closes readily, unless latched for transport. The drawer can also be removed from the drawer tray by lifting up and out.

Ordering

Any of these items can be ordered with the 1730-Series instrument. In addition, these items are available, along with accessory items listed in this manual, from your nearest Tektronix field office or distributor. Be sure to include both the name and number of any Field Upgrade Kits ordered.

Replaceable Electrical Parts

Section 8 Replaceable Electrical Parts

This section contains a list of the components that are replaceable for the 1730-Series. Use this list to identify and order replacement parts. There is a separate Replaceable Electrical Parts list for each instrument.

Parts Ordering Information

Replacement parts are available from or through your local Tektronix, Inc., Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available and to give you the benefit of the latest circuit improvements. Therefore, when ordering parts, it is important to include the following information in your order.

- Part number
- Instrument type or model number
- Instrument serial number
- Instrument modification number, if applicable

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc., Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

Using the Replaceable Electrical Parts List

The tabular information in the Replaceable Electrical Parts list is arranged for quick retrieval. Understanding the structure and features of the list will help you find all of the information you need for ordering replaceable parts.

Cross Index-Mfr. CodeThe Mfg. Code Number to Manufacturer Cross Index for the electrical parts listNumber to Manufactureris located immediately after this page. The cross index provides codes, names,
and addresses of manufacturers of components listed in the electrical parts list.

- Abbreviations Abbreviations conform to American National Standards Institute (ANSI) standard Y1.1.
- **List of Assemblies** A list of assemblies can be found at the beginning of the electrical parts list. The assemblies are listed in numerical order. When the complete component number of a part is known, this list will identify the assembly in which the part is located.

Diagrams/Circuit Board Illustrations

Section 9 Diagrams/Circuit Board Illustrations

Symbols

Graphic symbols and class designation letters are based on ANSI Standard Y32.2–1975.

Logic symbology is based on ANSI Y32.14–1973 in terms of positive logic. Logic symbols depict the logic function performed and may differ from the manufacturer's data.

Overline, parenthesis, or leading slash indicate a low asserting state.

Example: ID CONTROL, (ID CONTROL), or /ID CONTROL.

Abbreviations are based on ANSI Y1.1–1972.

Other ANSI standards that are used in the preparation of diagrams by Tektronix, Inc. are:

Y14.15, 1966 -- Drafting Practices.
Y14.2, 1973 -- Line Conventions and Lettering.
Y10.5, 1968 -- Letter Symbols for Quantities Used in Electrical Science and Electrical Engineering.

American National Standard Institute 1430 Broadway, New York, New York 10018

Component Values

Electrical components shown on the diagrams are in the following units unless noted otherwise:

Capacitors: Values one or greater are in picofarads (pF). Values less than one are in microfarads (μ F). Resistors = Ohms (Ω).

The following information and special symbols may appear in this manual.

Assembly Numbers

Each assembly in the instrument is assigned an assembly number (e.g., A20). The assembly number appears on the diagram (in circuit board outline), circuit board illustration title, and lookup table for the schematic diagram.

The Replaceable Electrical Parts List is arranged by assembly number in numerical sequence; the components are listed by component number. Example:

Grid Coordinates

The schematic diagram and circuit board component location illustration have grids. A lookup table with the grid coordinates is provided for ease of locating the component. Only the components illustrated on the facing diagram are listed in the lookup table.

When more than one schematic diagram is used to illustrate the circuitry on a circuit board, the circuit board illustration will only appear opposite the first diagram; the lookup table will list the diagram number of other diagrams that the other circuitry appears on.

1730-Series

Static Sensitive Devices See Maintenance Section

1730-SERIES WAVEFORM MONITOR

Replaceable Mechanical Parts

Section 10 Replaceable Mechanical Parts

This section contains a list of the components that are replaceable for the 1730–Series. Use this list to identify and order replacement parts. There is a separate Replaceable Mechanical Parts list for each instrument.

Parts Ordering Information

Replacement parts are available from or through your local Tektronix, Inc., Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available and to give you the benefit of the latest circuit improvements. Therefore, when ordering parts, it is important to include the following information in your order.

- Part number
- Instrument type or model number
- Instrument serial number
- Instrument modification number, if applicable

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc., Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

Using the Replaceable Mechanical Parts List

The tabular information in the Replaceable Mechanical Parts list is arranged for quick retrieval. Understanding the structure and features of the list will help you find all of the information you need for ordering replaceable parts.

Cross Index–Mfr. Code Number to Manufacturer Number to Manufactur Number to Manufacturer Number to Manufacturer

- Abbreviations Abbreviations conform to American National Standards Institute (ANSI) standard Y1.1.
- **Chassis Parts** Chassis-mounted parts and cable assemblies are located at the end of the Replaceable Electrical Parts list.

Column Descriptions

Figure & Index No. (Column 1)	Items in this section are referenced by figure and index numbers to the illustra- tions.
Tektronix Part No. (Column 2)	Indicates part number to be used when ordering replacement part from Tektronix.
Serial No. (Column 3 and 4)	Column three (3) indicates the serial number at which the part was first used. Column four (4) indicates the serial number at which the part was removed. No serial number entered indicates part is good for all serial numbers.
Qty (Column 5)	This indicates the quantity of mechanical parts used.
Name and Description (Column 6)	An item name is separated from the description by a colon (:). Because of space limitations, an item name may sometimes appear as incomplete. Use the U.S. Federal Catalog handbook H6-1 for further item name identification.
	Following is an example of the indentation system used to indicate relationship.
	1 2 3 4 5 Name & Description Assembly and/or Component Mounting parts for Assembly and/or Component *MOUNTING PARTS*/*END MOUNTING PARTS* Detail Part of Assembly and/or Component Mounting parts for Detail Part *MOUNTING PARTS*/*END MOUNTING PARTS* Parts of Detail Part Mounting parts for Parts of Detail Part *MOUNTING PARTS*/*END MOUNTING PARTS*
	Mounting Parts always appear in the same indentation as the Item it mounts, while the detail parts are indented to the right. Indented items are part of and included with, the next higher indentation. Mounting parts must be purchased separately, unless otherwise specified.
Mfr. Code (Column 7)	Indicates the code number of the actual manufacturer of the part. (Code to name and address cross reference can be found immediately after this page.)
Mfr. Part Number (Column 8)	Indicates actual manufacturer's part number.
